11-0.1, Apr 5, 2011

Goals

► Understand what a component-based system is

► Understand the difference of component-based and composition-based systems

► Understand the difference of component and composition systems

► What is a composition operator? composition expression? composition program? composition language?

► Understand the difference between graybox and blackbox systems (variability vs. extensibility)

► Understand the ladder of composition systems

► Understand the criteria for comparison of composition systems

Contents

- ► A little history of software composition

  - ▪ Comparison criteria for composition

- ► How it is realized for Invasive Software Composition
- ► Future software composition systems

Obligatory Reading

- ▶ [ISC], Chapter 1, Chapter 2

- ▶ Douglas McIlroy's home page
  http://cm.bell-labs.com/who/doug/

- ▶ [McIlroy] Douglas McIlroy. Mass Produced Software Components. In P. Naur and B. Randell, "Software Engineering, Report on a conference sponsored by the NATO Science Committee, Garmisch, Germany, 7th to 11th October 1968", Scientific Affairs Division, NATO, Brussels, 1969, 138-155.
  http://cm.bell-labs.com/cm/cs/who/doug/components.txt

1.1. Basics of Composition Systems

A **composition system** is used for component-based software engineering.

It has a component model, a composition technique, and a composition language.

Motivation for Component-Based Development

- ► Divide-and-conquer (Alexander the Great)
  - Well known in other disciplines
    - Mechanical engineering (e.g., German VDI 2221)
    - Electrical engineering
    - Architecture

- ► Outsourcing to component producers
  - Components off the shelf (COTS)
  - Goal:
    - Reuse of partial solutions
    - Easy configurability of the systems: variants, versions, product families

- ► Mass Produced Software Components [McIlroy]
  - Garmisch 68, NATO conference on software engineering
  - Every ripe industry is based on components, since these allow to manage large systems
  - Components should be produced in masses and composed to systems afterwards

Mass-produced Software Components

In the phrase `mass production techniques,' my emphasis is on `techniques' and not on mass production plain. Of course mass production, in the sense of limitless replication of a prototype, is trivial for software.

But certain ideas from industrial technique I claim are relevant.
•The idea of subassemblies carries over directly and is well exploited.
•The idea of interchangeable parts corresponds roughly to our term `modularity,' and is fitfully respected.
•The idea of machine tools has an analogue in assembly programs and compilers.

Yet this fragile analogy is belied when we seek for analogues of other tangible symbols of mass production.
•There do not exist manufacturers of standard parts, much less catalogues of standard parts.
•One may not order parts to individual specifications of size, ruggedness, speed, capacity, precision or character set.

Mass-produced Software Components

► Later McIlroy was with Bell Labs,

- ..and invented pipes, diff, join, echo (UNIX).
- Pipes are still today the most employed component system!

► Where are we today?

Definitions of Components

A software component is a unit of composition
- with contractually specified interfaces
- and explicit context dependencies only.

A software component
- can be deployed independently and
- is subject to composition by third parties.

(ECOOP Workshop WCOP 1997 Szyperski)

A reusable software component is a
- logically cohesive,
- loosely coupled module
- that denotes a single abstraction.   (Grady Booch)

A software component is a static abstraction with plugs.

(Nierstrasz/Dami)

Real Component Systems

- ► Lego
- ► Square stones
- ► Building plans
- ► IC's
- ► Hardware bus
- ► How do they differ from software?
What is a Software Component?

- ► A component is a *container with*
  - *variation points*
  - *extension points*
  - that are adapted during composition

- ► A component is a reusable *unit for composition*

- ► A component underlies *a component model*
  - that fixes the abstraction level
  - that fixes the grain size (widget or OS?)
  - that fixes the time (static or runtime?)

What Is A Component-Based System?

► A component-based system has the following divide-and-conquer feature:

  ▪ A component-based system is a system in which a major relationship between the components is **tree-shaped or reducible**.

► Consequence: the entire system can be reduced to one abstract node

  ▪ at least along the structuring relationship

► Systems with layered relations (dag-like relations) are not necessarily component-based.

  ▪ Because they cannot be reduced

What Is A Component-Based System?

► Because of the divide-and-conquer property, component-based development is attractive.

► However, we have to choose the structuring relation

► And, we have to choose the composition model

► Mainly, 2 types of models are known

  ▪ Modular decomposition (blackbox)

  ▪ Separation of concerns (graybox)
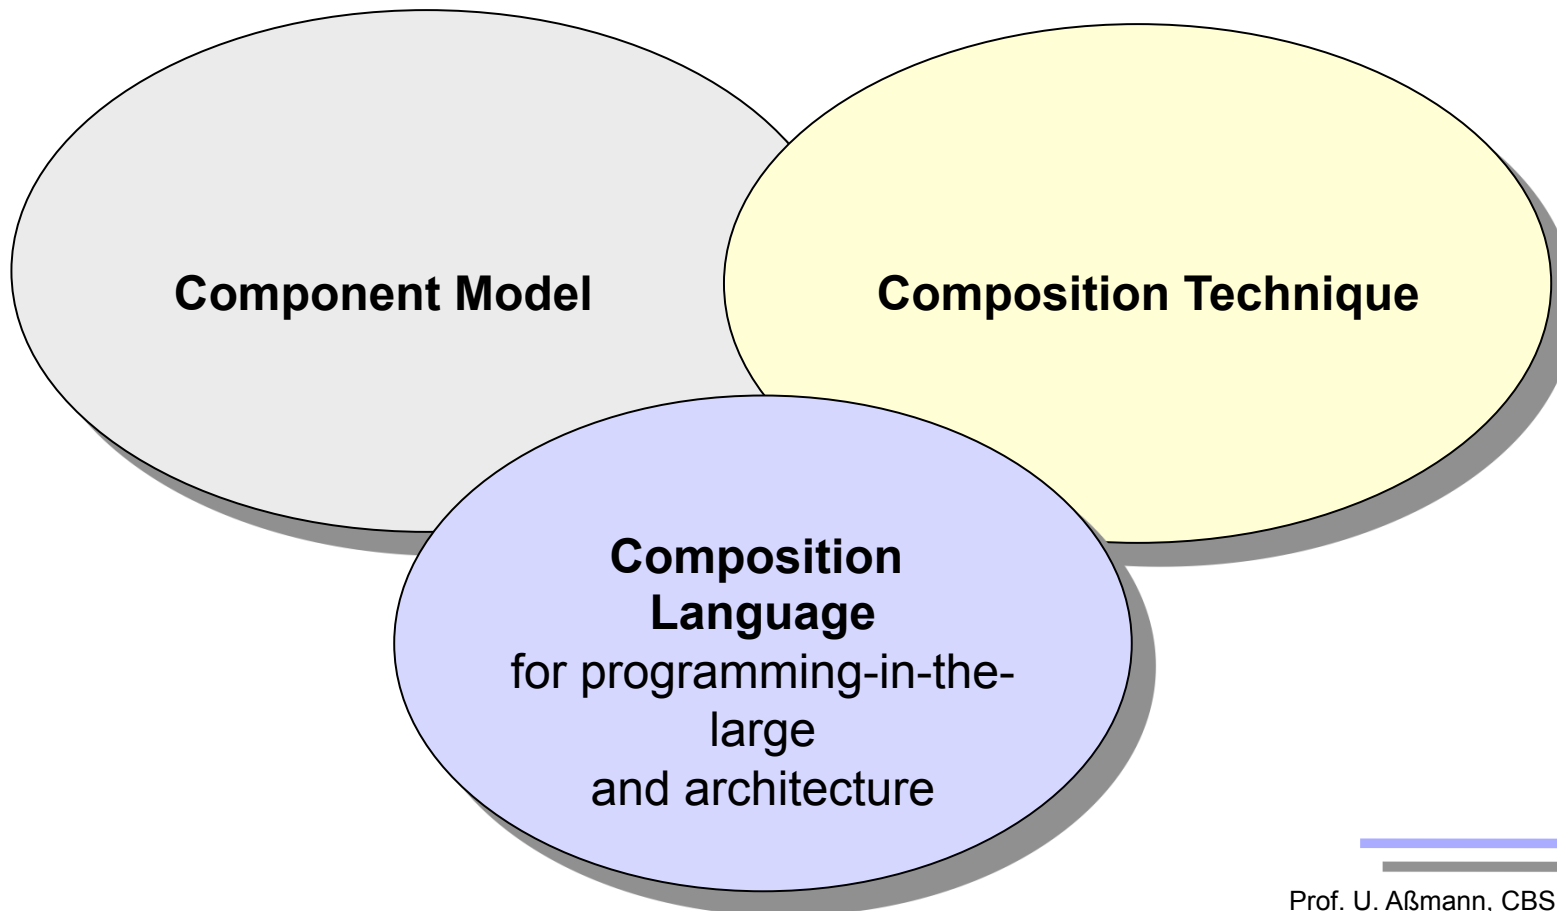

Component Systems (Component Platforms)

▶ We call a technology in which component-based systems can be produced a *component system* or *component platform.*

▶ A component system has

Component Model

for description of components

Composition Technique

for compositions of components

Composition Systems

► A composition system has

Component Model

Composition Technique

Composition Language
for programming-in-the-large
and architecture
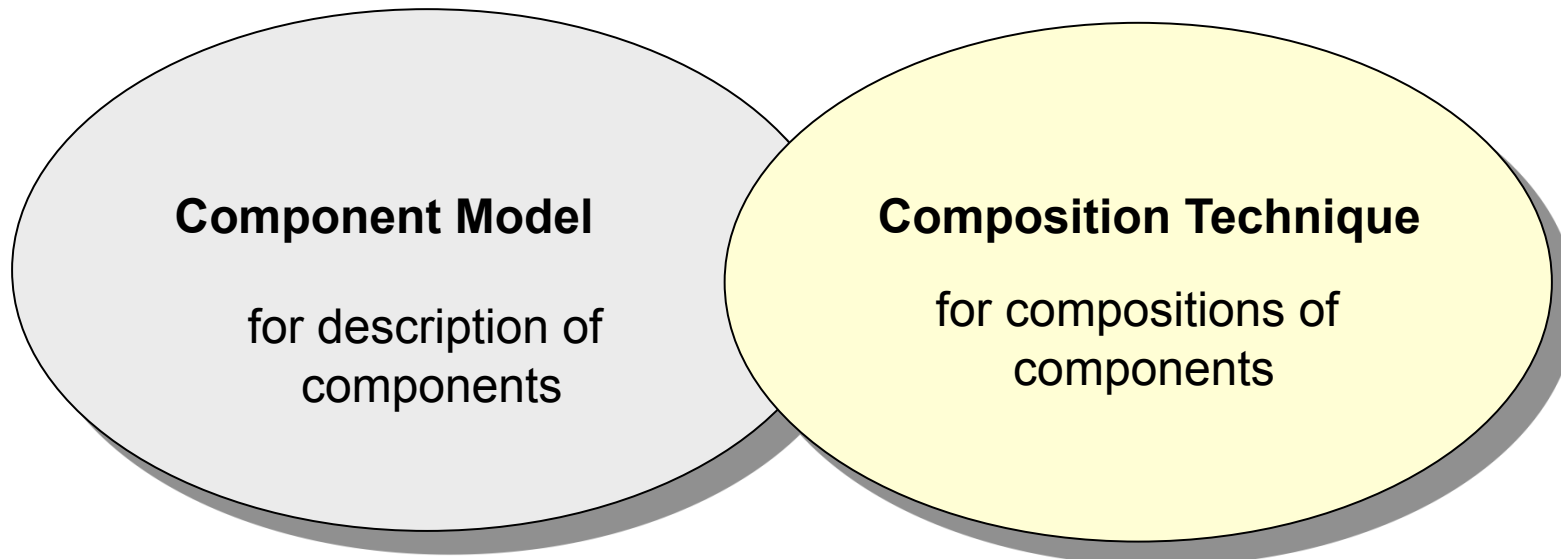

The Ladder of Component and Composition Systems

Aspect Systems	View Systems	Software Composition Systems
Aspect Separation	Composition Operators	Composition Language
Aspect/J	*Composition Filters Hyperslices*	*Invasive Composition Metaclass Composition Piccola*

Architecture Systems	**Architecture as Aspect**	*Darwin ACME*
Classical Component Systems	**Standard Components**	*.NET CORBA Beans EJB*
Object-Oriented Systems	**Objects as Run-Time Components**	*C++ Java*
Modular Systems	**Modules as Compile-Time Components**	*Modula Ada-85*

Desiderata for Flexible Software Composition

▶ Component Model:

  ▪ How do components look like?

  ▪ Secrets, interfaces, substitutability

▶ Composition Technique

  ▪ How are components plugged together, composed, merged, applied?

  ▪ Composition time (Deployment, Connection, ...)

▶ Composition Language

  ▪ How are compositions of large systems described?

  ▪ How are system builds managed?

▶ Be aware: this list is NOT complete!

Desiderata Component Model

► **CM-M: Modularity**

- M1 Component secrets (information hiding):
  - Location, way of deployment
  - Component lifetime
  - Component language
  - Explicit specification of interfaces (contact points, exchange points, binding points)
  - Provided and required interfaces

- M2 Semantic substitutability (conformance, contracts)
  - Syntactic substitutability (typing)

- M3 Content
  - Component language metamodel

► **CM-P: Parameterization** of components to their reuse context

- P1 Generic type parameters
- P2 Generic program elements
- P3 Property parameterization

► **CM-S: Standardization**

- S1 Open standards – or proprietary ones
- S2 Standard components
- S3 Standard services

Desiderata Composition Technique

- ► **CT-C: Connection and Adaptation**
  - C1: Automatic Component Adaptation: adapt the component interface to another interface
  - C2: Automatic Glueing: Generation of glue code for communication, synchronization, distribution. Consists of a sequence of adaptations
- ► **CT-E: Extensibility**
  - E1: Base Class Extension: can base classes be extended?
    - E1.1 Generated factories: can factories be generated
    - E1.2 Generated access layers
  - E2: Views. Use-based extensions: Can a use of a component extend the component?
  - E3: Integrated Extensions. Can extensions be integrated?

- ► **CT-A: Aspect separation**
  - AS1: Aspect weaving: Extension by crosscutting views
  - AS2: Multiple interfaces of a component
- ► **CT-S: Scalability (Composition time)**
  - SC1: Binding time hiding
  - SC2: Binding technique hiding
- ► **CT-M: Metamodelling**
  - MM1: Introspection and reflection (metamodel). Can other components be introspected? The component itself?
  - MM2: Metaobject protocol: is the semantics of the component specified reflectively?

Desiderata Composition Language

- ▶ **CL1: Product Consistency**
  - ▪ Variant cleanness: consistent configurations
  - ▪ Robustness: absence of run-time exceptions

- ▶ **CL2: Software Process Support**
  - ▪ Build management automation

- ▶ **CL3: Meta-composition**
  - ▪ Is the composition language component-based, i.e., can it be composed itself?
  - ▪ Reuse of architectures

- ▶ **CL4: Architectural styles** (composition styles)
  - ▪ Constraints for the composition

Service Components

► A *service component* is a software component whose location, style of deployment, and name is not known.

  ▪ It is described by metadata (attributes)

  ▪ [from Greenfield/Short, Software Factories, AWL]

1.2 Historical Approaches to Components

The Essence of the 60s-90s: LEGO Software

► Procedural systems

► Modular systems

► Object-oriented technology

► Component-based programming

  ▪ CORBA, EJB, DCOM, COM+, .NET

► Architecture languages
Components
Connectors
Composition recipe
Component-based applications

Procedure Systems

- ► Fortran, Algol

- ► The procedure is the static component

- ► The activation record the dynamic one

- ► Component model is supported by almost all chips directly

    - ▪ jumpSubroutine -- return

Caller

Linker

Callee
Procedures as Composition System

Component Model

Content: binary code with symbols

Binding points: linker symbols
procedures (with parameters) and
global variables

Composition Technique

Connection by linking object files

Program transformation on object files

Composition time: link-time, static

Composition Language

Modules (Information-Hiding-Based Design a la Parnas)

► Every module hides the an important design decision behind a well-defined interface which does not change when the decision changes.

We can attempt to define our modules "around" assumptions which are likely to change. One then designs a module which "hides" or contains each one.

Such modules have rather abstract interfaces which are relatively unlikely to change.

- Static binding of functional interfaces to each other

- Concept has penetrated almost all programming languages (Modula, Ada, Java, C++, Standard ML, C#)

Module
Linker

Module

A Linker is a Composition Operator

► Static linkers compose modules at link time

► Dynamic linkers at run time

Provided

Required
Linker

Bound procedure symbols, no glue code

Modules as Composition System

Component Model

Content: groups of procedures

Binding points: linker symbols
procedures (with parameters) and
global variables

Composition Technique

Connection by linking object files

Program transformation on object files

Composition time: link-time, static

Composition Language

UNIX Shells and Pipes (McIlroy)

► UNIX shells still offers the most used component paradigm

- Extremely flexible, simple

- Communication with byte streams, parsing and linearizing the objects

► Component model

- Content: unknown (depens on parsing), externally bytes

- Binding points: stdin/stdout/stderr ports

- More secrets: distribution, parallelism etc

► Composition technique: manipulation of byte streams

- Adaptation: filter around other components. Filter languages such as sed, awk, perl

- Binding time: static, streams are connected (via filters) during composition

► Composition languages

- C, shell, tcl/tk, python, perl…

- Build management language makefile

stderr

stdin　　　　**stdout stdin**
Filter

Filter

pipe

Shells and Pipes as Composition System

Component Model

Content: unknown (due to parsing), externally bytes

Binding points: stdin/out ports

Secrets: distribution, parallelism

Composition Technique

30

Object-Oriented Systems

► Components: objects (runtime) and classes (compile time)

  ▪ Objects are instances of classes (modules) with unique identity

  ▪ Objects have runtime state

  ▪ Late binding of calls by search at runtime

dispatch

Caller Object — Callee — Callee / Callee

sd&m-Konferenz 2003: Web Services

Prof. U. Aßmann, OBGr.
17.07.2003, Seite 31   31

Object-Oriented Systems

► Component Model

- Content: code (static) and values (dynamic)

- Binding points:
  - monomorphic calls (static calls)
  - polymorpic calls (dynamically dispatched calls)

► Composition Technique

- Adaptation by inheritance or delegation

- Extensibility by subclassing

► Composition Language: none

Object-Orientation as Composition System

Component Model

Content: binary files, objects

Binding points: static and polymorphic calls (dynamically dispatched calls)

Composition Technique

Composition Language

Architecture Systems

► Unicon, ACME, Darwin

  ▪ feature an Architecture Description Language (ADL)

► Split an application into:

  ▪ Application-specific part (encapsulated in components)

  ▪ Architecture and communication (in architectural description in ADL)

  ▪ Better reuse since both dimensions can be varied independently

Component Model in Architecture Systems

► Ports abstract interface points

  ■ in(data), out(data)

  ■ Components may be nested

► Connectors as special communication components

Interface

Port

Role

Connector
Architecture can be exchanged independently of components

► Reuse of components and architectures is fundamentally improved
The Composition Language: ADL

- ► Architecture language (architectural description language, ADL)
  - ▪ ADL-compiler
  - ▪ XML-Readers/Writers for ADL. XADL is a new standard exchange language for ADL based on XML
- ► Graphic editing of systems
- ► Checking, analysing, simulating systems
  - ▪ Dummy tests
  - ▪ Deadlock checkers
  - ▪ Liveness checking

ACME Studio
Architecture Systems as Composition Systems

Component Model

Source or binary components

Binding points: ports

Composition Technique

Adaptation and glue code by connectors

Scaling by exchange of connectors

Architectural language

Composition Language
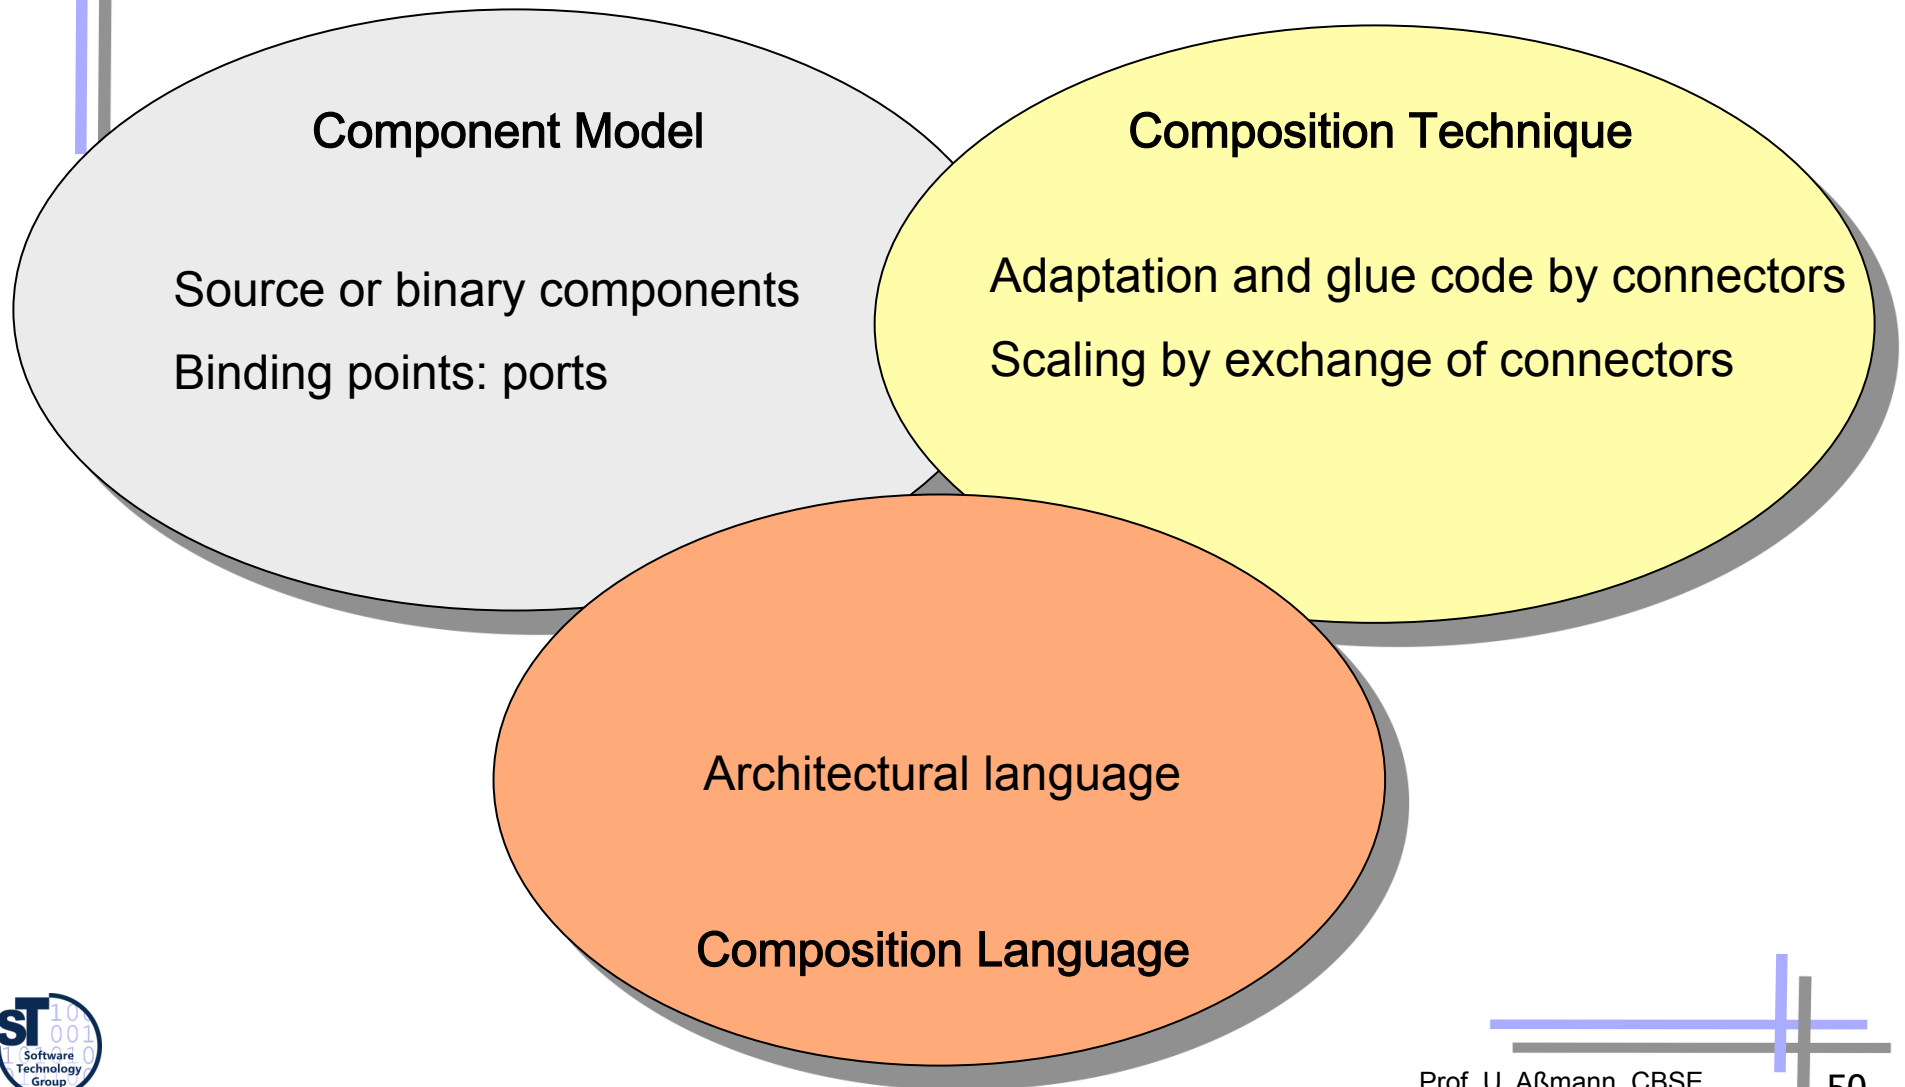

What the Composition Language Offers for the Software Process

► Communication

  ▪ Client can understand the architecture graphics well

  ▪ Architecture styles classify the nature of a system in simple terms (similar to design patterns)

► Design support

  ▪ Refinement of architectures (stepwise design, design to several levels)

  ▪ Visual and textual views to the software resp. the design

► Validation: Tools for consistency of architectures

  ▪ Are all ports bound? Do all protocols fit?

  ▪ Does the architecture corresponds to a certain style? Or to a model architecture?

  ▪ Parallelism features as deadlocks, fairness, liveness,

  ▪ Dead parts of the systems

► Implementation: Generation of large parts of the communications and architecture
Blackbox Composition
Components
Connectors

Composition recipe
**Component-based applications**

The Essence of Blackbox Composition

- ► 3 Problems in System construction
  - Variability
  - Extensibility
  - Adaptation

- ► In "Design Patterns and Frameworks", we learned about design patterns to tackle these problems

- ► Blackbox composition supports variability and adaptation
 - not extensibility

Invasive Connection

Composers Generalize Skeletons (Coordinators)

components + composers + variation points

↑ ↑

components + skeletons + ports

Composers Can Be Used For Skeletons (Coordinators)

► Instead of functions or modules, skeletons can be defined over fragment components

► CoSy coordination schemes (ACE compiler component framework www.ace.nl)
  ▪ Compose basic components with coordinating operators

coordinator

Composers Generalize Inheritance Operators (Classes as Components)

components + composers + extension points

$\uparrow$ $\uparrow$

components + mixin + feature lists

Composers Can Be Used For Inheritance

► Extension can be used for inheritance (mixins)

► inheritance :=

- copy first super document;

- extend with second super document;

inherit

Composers Generalize View Extensions
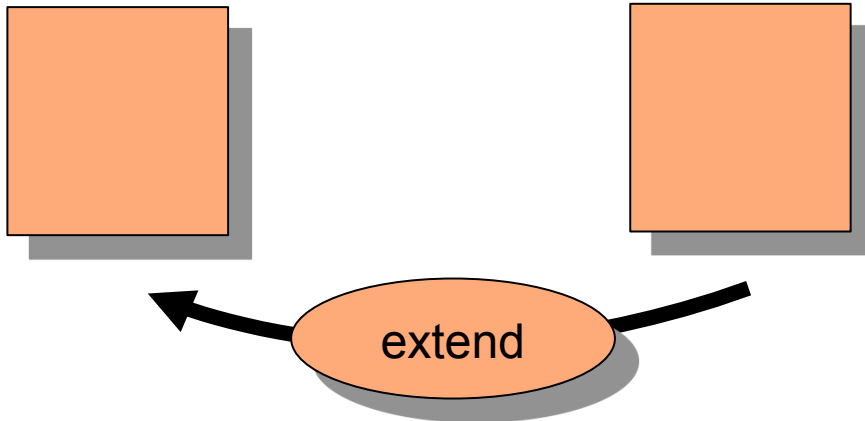

components + composers + extension points

↑   ↑

components   +   extend   +   views

Composers Generalize View-based Extensions

► A *core component* is extended by a *view component*

extend

Composers Generalize Aspect Weavers

components + composers + extension points

↑   ↑
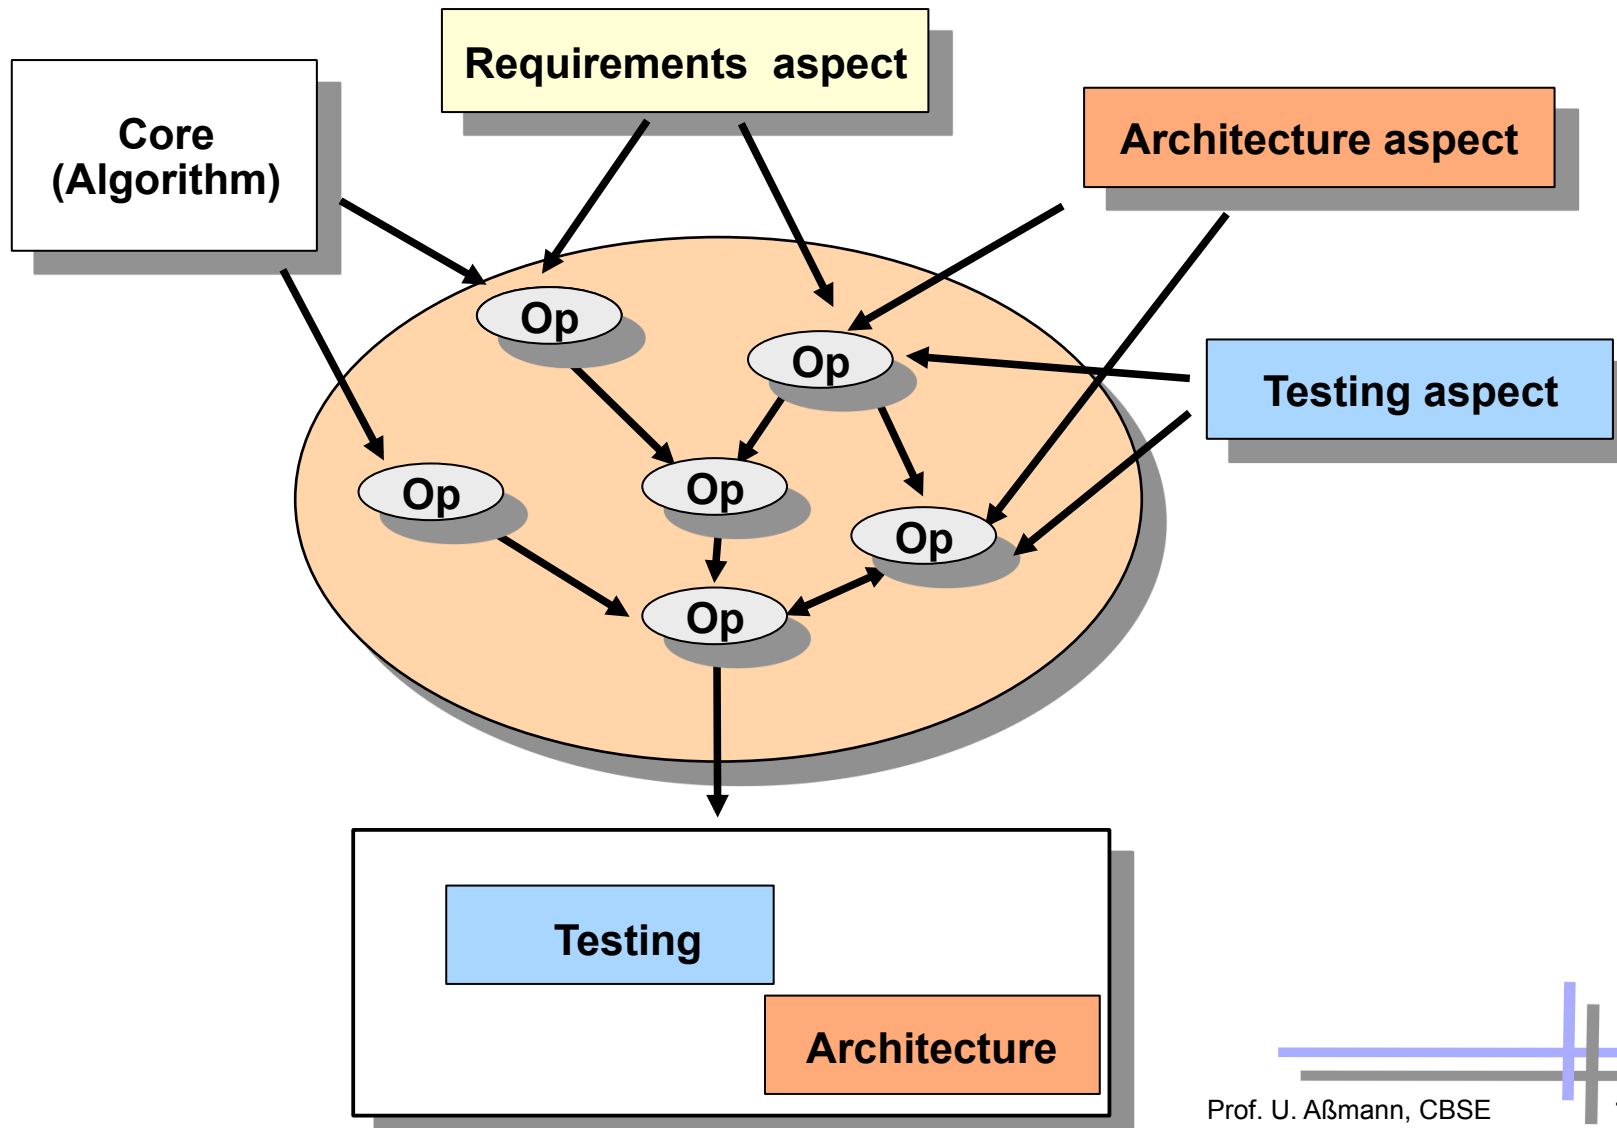

components   +   weaver   +   join points

Composers Generalize Aspect Weavers

► Complex composers *distribute* aspect fragments over core fragments

► *Distributors* extend the core

  ▪ Distributors are more complex operators, defined from basic ones

Weavers As Distributors

Composition Languages

► Composition Languages describe the structure of the systen in-the-large ("programming in the large")

► Composition programs combine the basic composition operations of the composition language

► Composition languages can look quite different

  ▪ Standard languages, such as Java

  ▪ Makefiles

► Enables us to describe large systems

Composition program size   1
System size   10

Conclusions for Composition Systems

- ► Components have *composition interface*

    - Composition interface is different from functional interface

    - The composition is running usually *before* the execution of the system

    - From the composition interface, the functional interface is derived

- ► System composition becomes a new step in system build

Steps in System Construction

► We need component models and composition systems on all levels of system construction

> System composition
> (System generation)

> System compilation

> System deployment

> System execution

What Have We Learned?

Component-based Systems

- ► ... are produced by component systems or composition systems

- ► ... have a central relationship that is tree-like or reducible

- ► ... support a component model

- ► ... allow for component composition with composition operators
  - ▪ ... and – in the large – with composition languages

- ► Historically, component models and composition techniques have been pretty different
  - ▪ from compile time to run time

- ► Blackbox composition supports variability and glueing

- ► Graybox composition supports extensibility

The Ladder of Composition Systems
