# 15. Web Services and Service-Oriented Architectures

Prof. Dr. Uwe Aßmann
Technische Universität Dresden
Institut für Software- und
Multimediatechnik
http://st.inf.tu-dresden.de

Version 13-1.1, May 31, 2013

- Web Services as a specific form of service-oriented architectures
- 2) SOAP
- 3) WSDL
- 4) BPEL
- 5) BPMN
- 6) Trust and security
- Evaluation

#### The Ladder of Composition Systems

	Software Composition Systems	Composition Int	vasive Composition Piccola Gloo	
	Aspect Systems	Aspect Separation Crosscutting	Aspect/J AOM	
	View Systems	Composition Operators	Composition Filters Hyperspaces	
	Architecture Systems	Architecture as Aspec Connectors	t Darwin BPMN HRC	Г
	assical omponent Systems	Standard Components Reflection	.NET CORBA Beans EJB ArchJava	
Ol	oject-Oriented Systems	Objects as Run-Time Components	C++ Java UML component	ts
М	odular Systems	Modules as Compile- Time Components	Shell scripts Modula Ada-8	5

#### 15.1 Web Services and Architecture Systems

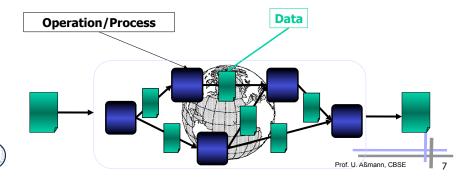

- Architecture systems may have different forms of architectural languages:
  - Topology-based (Unicon, ACME, Darwin)
  - Coordination schemes (CoSy)
  - Imperative scripts (Darwin)
- Web Service Systems and Languages (WSS) are a form of architectural system
  - They separate programming-in-the-small from programming-in-the-large (2-level programming)
    - . Components encapsulate the service knowledge
    - . The architectural level (orchestration, aggregation, composition) treats the big picture
- However, WSS have an imperative architectural language
  - They are based on XML standards (SOAP, WSDL, BPEL)

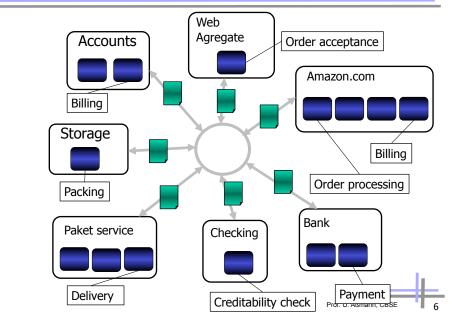

# Web Service Architectures are Described by Workflows

- Workflow specifications combine control and data flow
- Web service architectures are the first step to service-oriented architectures (SOA), based on traders
  - Services will be offered, searched and discovered, downloaded, executed
- ▶ Enterprise services transfers web services to business systems
- Customer services serve the end-user of the web.

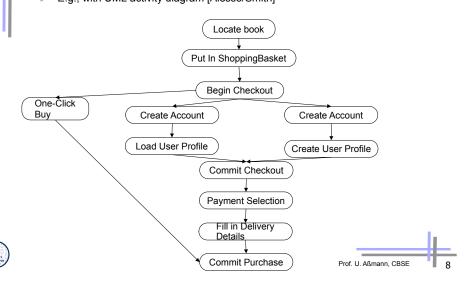

# Reuse of Web Services as Black-Box Components

### Ex. Buying a Book from Amazon

- Workflows can be specified graphically
  - ▶ E.g., with UML activity diagram [Alesso/Smith]

#### Which Types of Operational Specifications Exist?

- Data-flow graphs (data flow diagrams, DFD)
  - Data flows through operations
  - Activity diagrams: data flows through actions
  - See courses Softwaretechnologie II, Software-Entwicklungswerkzeuge
- Control-flow graphs (CFG)
  - Nodes are control-flow operations that start other operations on a state
  - The standard representation for imperative programs
- State systems
  - Finite State Machines (FSM): events trigger state transitions
  - Statecharts: Hierarchical FSM
  - Colored Petri nets: tokens mark control and data-flow, see course Softwaretechnologie II
- Mixed approaches
  - Cyclic data-flow graphs (also called static-single assignment graphs, SSA)
    - Cycles are marked by phi-nodes that contain control-flow guards

- A workflow language specifies control and data flow over a set of operations
  - The workflow is executable with an interpreter, the workflow engine
  - A single operation need not be executed automatically, but can be performed by humans (... for people)
  - The workflow runs in parallel
- Workflows are usually compiled to Colored Petri Nets or to Statecharts
  - YAWL (van der Aalst, Einhoven)
  - Workflow Nets
- Industrial Examples:
  - Lotus Domino (IBM)
  - Business Process Execution Language (BPEL)
  - ARIS system for SAP, based on EPC (event process chains)
  - Business Process Modeling Notation (BPMN), also in use at SAP

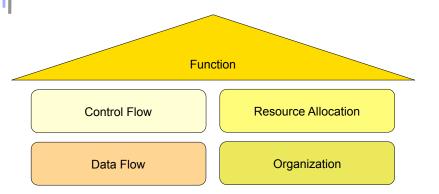

# **Workflows Have Aspects**

Standard workflow modeling discerns about 5 aspects ex. ARIS house [Scheer's company IDS, now Software AG]

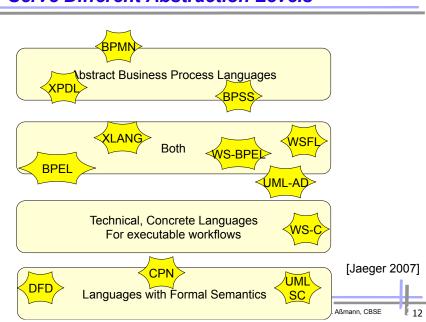

## Web Service Languages Serve Different Abstraction Levels

# Typical Control-Flow Operators in Workflow Languages (Gateways)

- Control-flow operators in Workflow languages are more complex than simple transitions in Petri Nets, which support only AND-split and -join
- AND-split: all
- AND-join: all of n

XOR-split: 1 of n

XOR-join: 1 of n

OR-split: m of n

OR-join: m of n

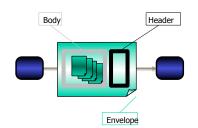

# 15.3 SOAP, An XML-based Interaction Protocol

- Simple Object Access Protocol (SOAP) defines the message format
- Message contains target address and an envelope
  - with name space, encoding attributes and
  - Header (fixed format) contains
    - . Authentication (Sender, Receiver),
    - . Transactions.
    - . Error handling information,
    - . Routing information ...
  - Body contains user data (free format)
- Transport is transparent, predefined channels:
  - HTTP (with back channel, de facto standard)
  - SMTP, TCP (with back channel)

## What are Workflow Engines?

- Workflow engines are interpreters of workflows
  - They maintain the parallelism in a workflow and synchronize all processes
- Usually, they also support for interactive applications
  - Undo
  - Transactions with rollback and commit
  - Compensation (in case of error)
- They are, for web services and component systems, *composition* engines that execute a composition program, the workflow

Prof. U. Aßmann, CBSE

#### **Example: SOAP Header**

```
Message Header
                                           HTTP
POST /TreatmentAdmin HTTP/1.1
HOST: www.hospital-admin.com
Content-Type: text/xml
Charset="utf-8"
Content-Length: nnnn
SOAPaction: http://localhost/TreatmentAdmin
<SOAP-ENV:Envelop
   xmlns:SOAP-ENV=http://schemas.xmlsoap.org/soap/envelop/
   SOAP-ENV: Encoding="http://.../encoding">
   <SOAP-ENV:Header>
        <a:Authentication
    xmlns:a=http://localhost/TreatmentAdmin ... >
        </a:Authentication>
   </SOAP-ENV:Header>
   <SOAP-ENV:Body> ... </SOAP-ENV:Body>
                                                    SOAP Envelop
</SOAP-ENV:Envelop>
```

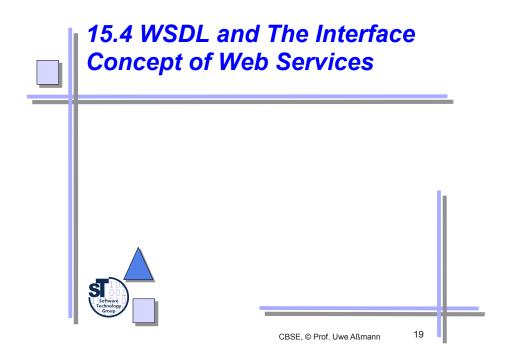

#### Example: SOAP Body

```
<SOAP-ENV:Body>
<m:AddTreatment xmlns:a=http://localhost/TreatmentAdmin>
<treatment>
  <service>
    Mkey>1234-A</mkey>
<mkey>1234-A</mkey>
<date>2001-01-30</date>
<diagnosis>No complications.
</diagnosis>
  </service>
</treatment>
</SOAP-ENV:Body>
```

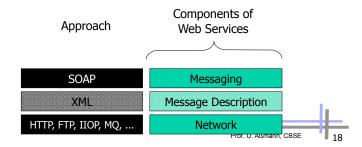

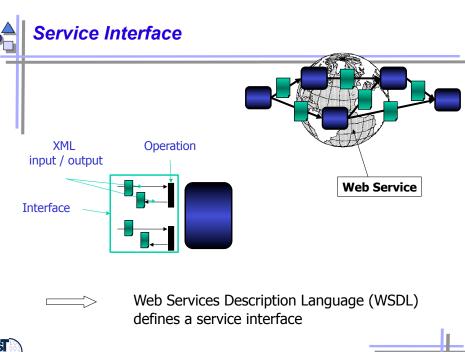

#### **SOAP Interaction Protocol**

- + W3C Recommendation (standard)
- + Implements RPC
- Untyped user data, types to encode in the message
- Interpretation of SOAP messages required
- High overhead / low performance

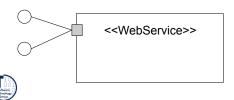

#### **WSDL** Components and Their Interfaces

- A WSDL Interface consists of a set of ports
  - Functions with types of parameter and results in XML Schema
  - Event ports
  - Plays a similar role as ports of a UML component
- Advantages
  - WSDL abstracts from underlying protocol (http, SOAP, mime, IIOP)
  - Component model can be mapped to CORBA, EJB, DCOM, .NET
  - WSDL unifies call and event ports
  - WSDL abstracts from the underlying component model, introducing the component model as a secret

#### WSDL Reuses Data Types of XSD Here: Type Definitions <schema> <element> <complextype>

```
<wsdl:types>
  <XMLSchema:schema ... [target name space definitions]>
     <XMLSchema:element name="addTreatment">
              <XMLSchema:complextype>
                <XMLSchema: sequence>
                   <s:element minOccurs="1" maxOccurs="1" name="parameter"</pre>
                                nillable="true" type="a:treatment"/>
                </XMLSchema:sequence>
              </XMLSchema:complextype>
     </XMLSchema:element>
     <XMLSchema:element name="addTreatmentResponse">
              <XMLSchema:complextype>
                < XMLSchema: sequence>
                   <s:element minOccurs="1" maxOccurs="1" name="result"</pre>
                                nillable="true" type="XMLSchema:bool"/>
                </XMLSchema:sequence>
              </XMLSchema:complextype>
     </XMLSchema:element>
     <XMLSchema:complextype name='treatment'> ...
              </XMLSchema:complextype>
  </XMLSchema:schema>
<wsdl:tvpes>
```

Prof. U. Aßmann, CBSE

## **WDSL Specification Structure**

- Types
- In XML schema or another typing language
- Messages
  - The data that is communicated
- Operation
  - An interface of the service, with input and output, fault parameters
- Port type
  - A named set of operations (as in UML)
- Binding
  - A mapping of the port to underlying component models, e.g., http, soap, or mime
- Service
  - A set of related ports

## Port Types

- Event or message based:
  - Notification: data-out port
  - One-way: data-in port
- Call-based
  - Request-Response: procedure port
  - Solicit-Response: send, then receive (caller port)

# Example: WSDL Ports, Typed by Message Types

```
<wsdl:definitions [name space definitions]>
    <wsdl:types> ... </wsdl:types>
    </wsdl:message>
  <wsdl:message name="addTreatmentSOAPOut">
    <part name="parameters" element="addTreatmentResponse"/>
 </wsdl:message>
 <wsdl:porttype name="TreatmentAdminSOAP">
                                               Actual interface
   <wsdl:operation name="addTreatment">
     <wsdl:input message="addTreatmentSoapIn"</pre>
     <wsdl:output message="addTreatmentSoapOut">
   </wsdl:operation>
 </wsdl:porttype>
 <binding [binding to SOAP / HTTP Protocols] ...</pre>
</wsdl:definitions>
```

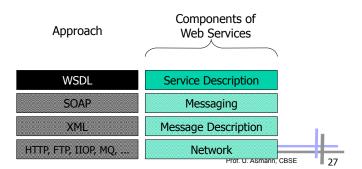

#### WSDL Service Interface

- WSDL is a Interface Definition Language (IDL)
  - Part of BPEL (see later)
  - No inheritance on WSDL
  - No standard mapping to data in programming languages
  - No web service as parameters/results
- W3C Recommendation (standard)

#### Example: Binding WSDL to SOAP

#### Trading on the Web: Offer and Find Services

- Standardized publishing, advertisement ...
- Extended name server, describing interface and properties
- XML Descriptor

White Page: Address

Yellow Page: Semantics (based on standard taxonomy)

Green Page: Technical specification of service

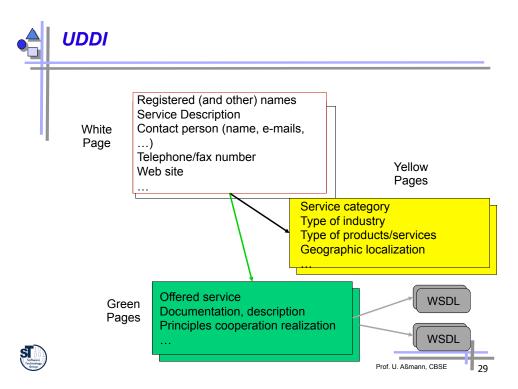

Logically central, physically distributed data base

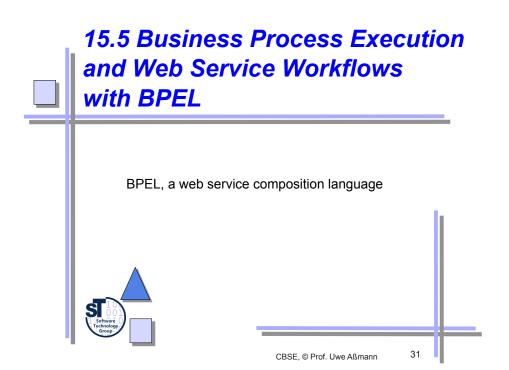

Universal Description, Discovery and Integration (UDDI) defines service properties for service trading

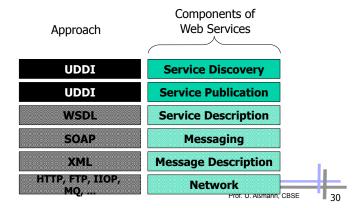

#### **UDDI: Offer and Find Services**

- -Required and approached
- No search strategies
- No no trader or market place

#### What is a Business Process?

"A collection of related, structured activities--a chain of events--that produce a specific service or product for a particular customer or customers."

www.gao.gov/policy/itguide/glossary.htm

"A business process is a recipe for achieving a commercial result. Each business process has inputs, method and outputs. The inputs are a prerequisite that must be in place before the method can be put into practice. When the method is applied to the inputs then certain outputs will be created."

en.wikipedia.org/wiki/Business process

- A business process is described on the modeling level, can be abstract, underspecified and need not be executable
- A business process can be refined iteratively to become executable.
- An executable business process is called a workflow (executable business process).

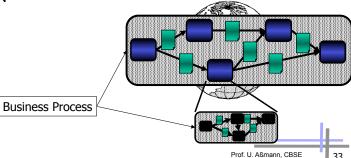

#### **Business Process Definition**

- How to define a business process on the web
- There are many languages proposed today:
  - WSFL, WSCL, WSCI, XLANG, WSEL, UML, WSUI, WSXL, BPML, BPMN ...
- ► IBM & Microsoft: BPEL, BPEL4WS
- OASIS: WS BPEL
- W3C: OWL-S, SML (Service Modeling Language)
- SAP: BPMN

#### **BPEL Made Simple**

- BPEL is a activity-diagram like language,
  - with parallelism and transactions
  - with different kind of join and split operators
  - with ports and connections
  - BPEL can be edited graphically, and has an XML abstract syntax
- To create a web service, becomes a similar activity as editing an UML activity diagram or Petri Net
- BPEL uses WSDL definitions to define types, message types, and port types
  - WSDL definitions can be without binding
    - . Bindings can be added when the BPEL process is deployed
    - . That increases reuse of the process
  - This achieves component model transparency (independence of the underlying component model)
  - Partner link types (connector types) describing typed connections

#### Ingredients of BPEL

- BPEL is an executable language for workflows, executable business processes
  - An architectural language for web services
  - Based on workflow languages
  - Mixing control and data flow operators
- ▶ BPEL is a composition language
  - Composing web services, using their ports
  - Relying on messages (events) and calls
- BPEL uses WSDL for service interface descriptions, as IDL
- ▶ BPEL adds connections (partner link types)

#### **BPEL Specification Structure**

- Process definition: Header with namespace declarations
- Variables: global variables of the process
- PartnerLink declarations: interface declaration
  - with whom is the process connected?
- Partners: actual partners of the communication
- Correlation sets: Which instance of a process is talking to which other instance?
- Fault handler: What happens in the case of an exception?
- Compensation handler: compensation actions
- Event handler: what happens in case of a certain event?
- A (structured) main operation
  - e.g., sequence or flow

#### A Simple Pizza Order

```
<!-- Process definition -->
cprocess name="OrderPizza" suppressJoinFailure="yes"
xmlns="http://schema.xmlsoap.org/ws/2003/03/business-process"
    pns="http://www.pizza.org/schema">
<partnerLinks>
  <partnerLink name="PizzaService" partnerLinkType="pns:OrderChannel"</pre>
    myRole="PizzaOrderer">
</partnerLinks>
                                                                        Connector
<!-- Global Variables -->
<variables>
 <variable name="input" messageType="PizzaOrder"/>
 <variable name="output" messageType="PizzaDelivery"/>
</variables>
<faultHandlers> ... </faultHandlers>
<sequence name="body">
 <invoke name="order" partnerLink="PizzaService" portType="PizzaOrder"
    operation="body" variable="output">
 <receive name="acknowledgement" partnerLink="PizzaService" portType="Pizza"</p>
    operation="body" variable="input">
```

# Other Operations in BPEL

- Structured control-flow operators
  - sequence
  - switch
  - while
  - flow

</sequence>

</process>

- pick (XOR join)
- terminate
- Compensate
  - Error compensation
- scope
- assign

Prof. U. Aßmann, CBSE

## Flow Operations are Workflow Graphs

- ► The <flow> operation is structured as a workflow graphs
  - The names of messages, ports, partner links help to span up the graph
    - <flow> executes its sequences in parallel
  - links> can synchronize parallel tasks

```
<flow>
links><link> name="A"</link>
link>name="B"</link>
</links>
<sequence>...<invoke> <target name="A">...</sequence>
<sequence>...</target name ="B">...</sequence>
</flow>

A

B

B
```

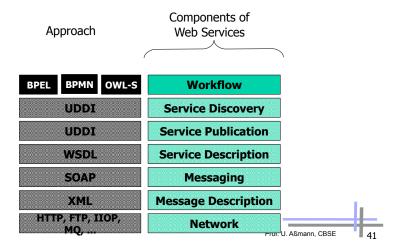

#### **BPEL Tools**

- http://en.wikipedia.org/wiki/BPEL
- Eclipse BPEL project
  - http://www.eclipse.org/bpel/
- Orchestra tool
  - http://orchestra.ow2.org/xwiki/bin/view/Main/WebHome
- People work on the translation of Colored Petri Nets and UML activity diagrams from and to BPEL
  - CPN have good formal features (see ST-2)
  - Can be used for deadlock checking, resource control, etc.
  - YAWL is such a nice language, see the work of [van der Aalst]

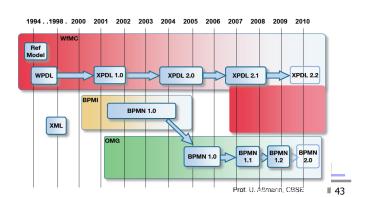

# Business Process

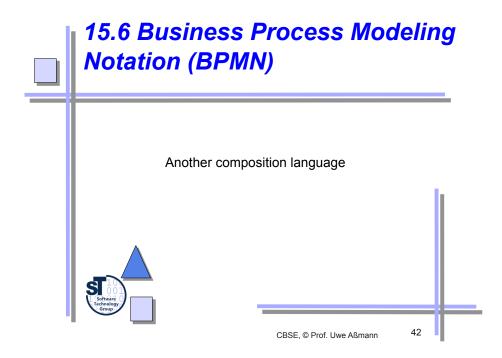

## **History**

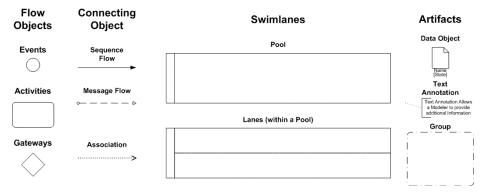

- The Business Process Modelling Notation (BPMN)
- Graphical notation for conceptual business processes
- · Covers control, data, authorization, exception
- · Standardized by OMG

#### **Core Set of BPMN Elements**

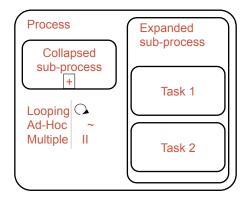

#### **Activities and Processes**

An **activity** is a generic type of work that a company performs. An activity can be atomic (task) or compound (process, sub-process).

#### **Gateways and Connections**

A gateway is used to split or merge multiple process flows. It will determine branching forking, merging and joining of paths.

#### Gateway control types

Data based exclusive decision or merging. Both symbols have equal meaning. See also Conditional flow

Event based exclusive decision only.

Data based inclusive decision or

Complex condition (a combination of

Parallel forking and joining

#### **Graphical connectors**

Normal sequence flow Conditional	<b></b>
sequence flow Default	$\Diamond$
sequence flow	<b>\</b>
Message flow	o
Association	

Prof. U. Aßmann, CBSE

#### **Events and Activities**

Events affect the flow of the process and usually have a cause (trigger) or an impact (result): 'Email received', 'Warehouse empty'

## **Events** Intermediate **Event Types** Message

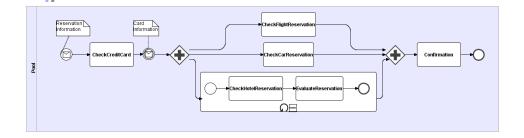

#### **Example: Travel Process Control Flow**

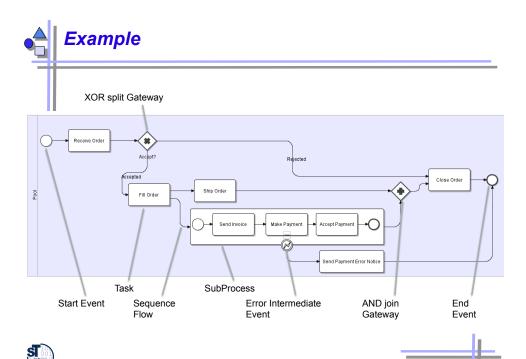

More refinement leads to business process specifications (with control and data flow)

#### BPMN v1.x

Modeling language, no execution semantics

BPMN includes a partial mapping to Business Process Execution Language (BPEL)

Changes in the BPMN model do not update in the BPEL code

#### BPMN v2.x

**Execution semantics** 

Explicit service mapping

First engines are available (jBPM for jBoss)

#### BPMN geared towards business analysts:

BPMN constructs are simplified

UML notation too bloated

BPMN is on the platform-independent level, BPEL nearer the platform-specific level

52

CBSE, © Prof. Uwe Aßmann

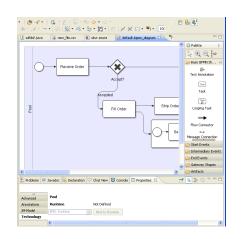

# Give BPMN a try

Free BPMN Editor from Eclipse Included in the SOA **Tools Project** 

#### http://www.eclipse.org/bpmn/

http://www.eclipse.org/ bpmn2-modeler/

SAP has decided to use BPMN in their products

Prof. U. Aßmann, CBSE

# 15.7 Trust and Security

### **Trust and Security**

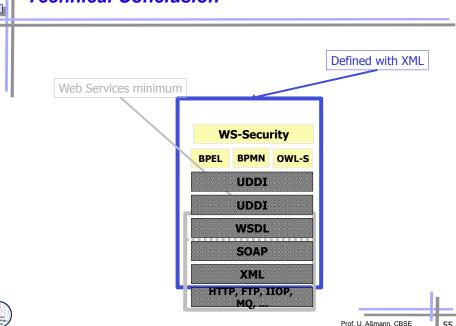

- Policies: when do I allow somebody to do something
- Integrity: intact, unchanged
- Confidentiality: cryptification policy
- Authentication: proof of identity
- Authorization: access to execute certain services
- Non-Repudiation: waranty on failior
- Legal Rights: copy rights, reselling rights, ...
- Privacy: handling personal data
- **.**.

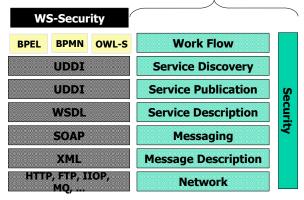

#### **Technical Conclusion**

### **Trust and Security**

Components of Web Services

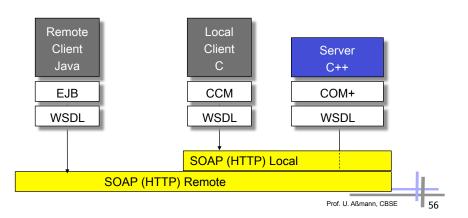

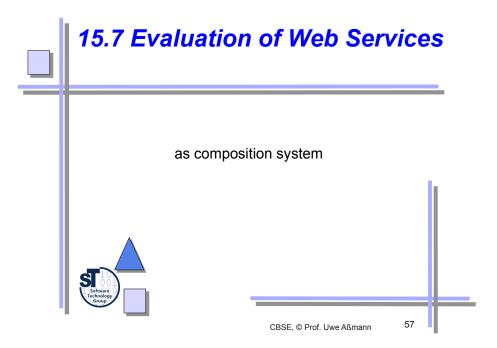

# Web Services – Component Model Transparency

- Language adaptation: XML Schema + WSDL
- Remote transparency: SOAP (+ HTTP)
- Component model transparency (EJB, COM+, CORBA, CCM, Beans, etc...)

#### **Composition Technique**

- Mechanisms for connection
  - Protocol transparency allows for flexible connections
  - WSDL binding is flexible
- Mechanisms for aspect separation
  - Separate modeling from execution (abstract business processes from workflows)
- Scalability: Better
  - Changes of protocol possible
  - Changes of distribution easy
  - Changes of workflow easy

# **Component Model**

- Mechanisms for secrets and transparency: very good
- Location, language, component model transparency
  - Communication protocol transparency
  - Interface specification is flexible with WSDL
  - Different black-box component models can be hidden under WSDL specifications
- Generic BPEL Web Services are possible (without bound WSDL ports)
- BPMN Web Services can be stepwise refined from abstract to concrete

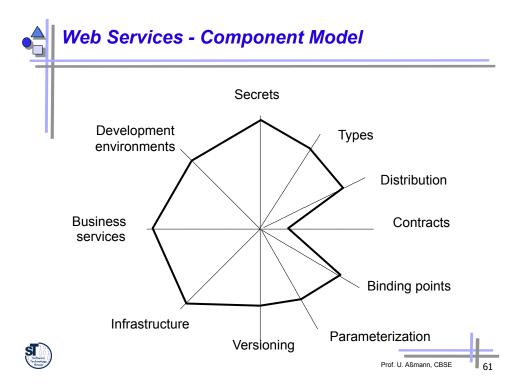

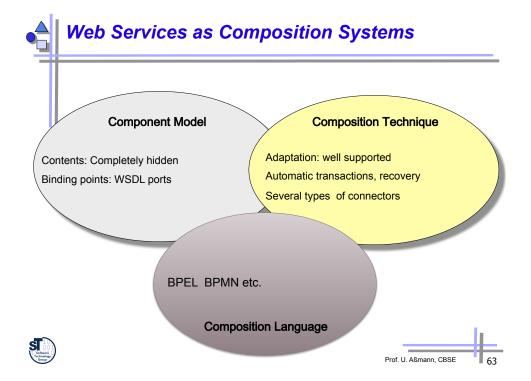

# **Composition Language**

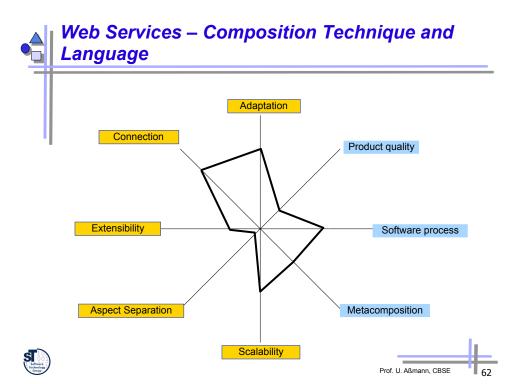

- ▶ BPEL, BPMN are flexible composition languages
  - Not yet full exchangeability of connector types
  - But graphic support for workflow specifications
  - Control- and data-flow operators (gateways)
  - Parallel execution semantics
  - Abstract (business processes) and executable level (workflows)
- Metacomposition fully supported
  - The generation of a BPEL or BPMN script is easy, because it is XML based
  - Environments generate workflow from other specifications
  - Generic workflow architectures will be possible

## So Far: Blackbox Composition

- Standard middleware
  - CORBA, DCOM
- Implicit middleware
  - EJB
- Architecture systems
  - Web services

### The Ladder of Component and Composition **Systems**

	Aspect Systems	View Systems	Soft Com	ware position

ebXML: Electronic Business XML

UDDI: Universal Description, Discovery and Integration

OAG: Open Applications Group

Organization for the Advancement of Structured OASIS: Information Standards

SOAP: Simple Object Access Protocol HTTP: Hypertext Transfer Protocol

tpaML: Trading Partner Agreement Markup Language

UML: Unified Modeling Language

United Nations Centre for the Facilitation of Procedures and Practices in Administration, Commerce and Transport UN/CEFACT:

WSFL: Web Services Flow Language WSDL: Web Services Description Language WSIL: Web Services Inspection Language WSXL: Web Services Experience Language WSCL: Web Services Conversation Language

WSUI: Web Services User Interface WSML: Web Services Meta Language

WSCM: (Web Services Component Model) Numer omdöpt till WSIA

WSIA: Web Services for Interactive Applications

WSEL: Web Services Endpoint Language WSRP: Web Services for Remote Portals

#### The Second Part of the Course: **Greybox Composition**

#### Generic programming

Generic program elements

Home-made connectors

#### View-based programming

Formal foundations (lambda

N, pi-calculus)

Record calculi, Scala

Hyperspace programming

#### Aspect-oriented development

Aspect-oriented programming Aspect-oriented design

Invasive software composition

Slots and hooks

#### Novel Forms of

Composition

Uniform composition

Active document composition: Architectural styles for active documents and web systems

Roundtrip engineering and composition

- www.biztalk.org
- www.soapclient.com
- www.soapware.org
- www.xml.com
- www.xml.org
- www.webservices.org
- www.webservicesarchitect.com
- www.ws-i.org

#### The End

- Many slides inherited from
- Stig Berild's talk on the Nordic Conference on Web Services, Nov. 2002
- Prof. Welf Löwe, Web Service Competence Center (WSCC), Växjö Linnaeus University

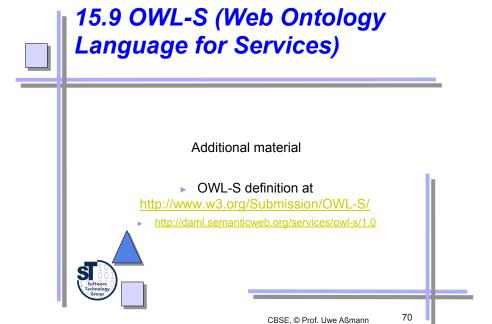

#### **OWL Web Ontology Language**

- Classes and relationships
- Expressions to compute (derive) new classes and relationships (derived model)
  - Union, intersection of relations and classes
  - Cardinality restrictions
  - Existential quantifiers
- Roughly speaking, OWL corresponds to UML-class diagrams without methods + OCL + class expressions
- Instead of plain XML, OWL can be used to type data
  - Beyond trees and context-free structures, graphs, knowledge webs, semantic nets can be described (context-sensitive structures)

#### **OWL-S**

- Based on OWL, a language for specification of web services has been developed by the OWL-S coalition
- Specification has three parts:
  - Service profile: semantic service description, service offer, service functionality (what does the service provide?)
    - . Based on domain ontologies in OWL, i.e., OWL-specified attributes
  - Service model: service realization, decomposition of a service (how does the service work?)
    - . Service is also called a process
    - . Here, OWL-S provides a process ontology
  - Service grounding: service mapping to underlying mechanisms (how is the service mapped to a component model and transport protocol?) Similar to WSDL grounding

#### **OWL-S Processes**

#### Atomic

- Cannot be decomposed
- Can be called and executed
- Can be mapped to WSDL process descriptions (grounding), and hence, to SOAP

#### Simple

- Cannot be decomposed
- Can be executed, but not be called from outside

#### Composite

. Build from atomic and simple processes

## Creating an OWL-S specification

- Describe atomic processes
- Describe grounding of atomic processes
- Describe compositions
- Describe simple processes
- Describe profile of service

Service Model (Process Model) of

Describes a service (process) with an IOPE specification

Process control ontology (for composite processes)

Internal realization with state, activation, execution, completion (control-flow

- Unordered (unspecified order)
- Sequence

**OWL-S** 

Process Ontology

Inputs

Outputs Parameters

Effects

- Split
- Split+Join (fork and join)
- Concurrent
- Choice
- If-then-else
- Repeat-until
- Repeat-while
