15. Mai 2018

1. Basics
2. Dynamic Call
3. Traded Call
4. Evaluation according to our criteria list
5. Appendices
Obligatory Reading

- ISC, 3.1-3.3
- Szyperski 2nd edition, Chap 13
- [http://java.sun.com/javase/7/docs/technote...](http://java.sun.com/javase/7/docs/technote/guides/idl/)
Literature

- R. Orfali, D. Harkey: Client/Server programming with Java and Corba. Wiley&Sons. easy to read.
- CORBA 3.3 specification: http://www.omg.org/spec/CORBA/3.3/
- Jens-Peter Redlich, CORBA 2.0 / Praktische Einführung für C++ und Java. Verlag: Addison-Wesley, 1996. ISBN: 3-8273-1060-1
22.1 Basic Mechanisms
CORBA: Common Object Request Broker Architecture®

- Founding year of the OMG (object management group) 1989
- Goal: plug-and-play components everywhere

- CORBA 1.1 1991 (IDL, ORB, BOA)
- ODMG-93 (Standard for OO-databases)
- CORBA 2.0 1995, later 2.2 and 2.4
- CORBA 3.0 1999
- CORBA 3.3 2012
- CORBA is large
  - Interface Specification – 500 pages
  - Interoperability Specification – 250 pages
  - Component Model Specification – 380 pages
Ingredients of CORBA

- **Component Model**
  - Components are classes and objects, i.e., similar to object-oriented software
  - In CORBA 3.0, the CCM has additionally been introduced
  - Components have component secrets
    - Language interoperability by uniform interface description
    - Location transparency
    - Name transparency
    - Transparent network protocols
  - Standardization
    - CORBA Services (Transactions, Trader, etc.)
    - CORBA Facilities (Application-oriented)
      - Horizontal
        - for many application classes
        - e.g., Distributed Document Component Facility
      - Vertical
        - for a single application class
        - e.g., banking
- **Composition Techniques**
  - Adaptation by stubs and skeletons
  - CORBA MOF for metamodelling
OMA (Object Management Architecture)

- A software bus, based on the Mediator (Broker) design pattern
  - Coupled by decorator-connectors
The Top Class CORBA::Object

- The class CORBA::Object defines a component model
  - The class must be inherited by all objects in the application

- CORBA supports reflection and introspection:
  - get_interface delivers a reference to the entry in the interface repository
  - get_implementation a reference to the implementation

- Reflection works by the interface repository (list_initial_references from the CORBA::::ORB interface).
Problem: Multiple Inheritance of CORBA Object

- CORBA::Object includes *code* into a class
- Many languages only offer single inheritance
  - Application super class must be a delegatee
  - Only some languages offer mixin inheritance (mixin layers), such as Scala, C# 4.0, Eiffel
Basic Connections in CORBA

- CORBA composes components with connections
  - Static method call with static stubs and skeletons
    - Local or remote is transparent (compare to EJB!)
  - Polymorphic call
    - Local or remote
  - Event transmission
  - Callback (simplified Observer pattern)
  - Dynamic invocation (DII, request broking, interpreted call, symbolic call)
    - Searching services dynamically in the web (location transparency of a service)
  - Trading
    - Find services in a yellow pages service, based on properties
  - Important: CORBA is language-heterogeneous, i.e., offers these services for most of the main-stream languages
22.2 Dynamic Call Connector (with Object Request Broking)

- (Reified or interpreted call)
Dynamic Call Connector (Request Broking)

- CORBA *dynamic call* is a *reified call (interpreted call)*, i.e., a reflective call with a symbolic name and arguments
  - Without knowing that the service exists
  - Services can be dynamically exchanged, brought into play a posteriori
  - Without recompilation of clients, nor regeneration of stubs
  - Binding of names to addresses is dynamic

- Requires descriptions of semantics of service components
  - For identification of services
    - Metadata (descriptive data): catalogues of components (interface repository, implementation repository)
    - Property service (later)

- and a mediator, that looks for services: the ORB
Object Request Broker (ORB)

- For a dynamic call, the ORB must be involved
- The ORB is a *mediator* (design pattern) between client and server
  - Hides the the environment from clients
  - Can talk to other ORBs, also on the web
  - Basic Object Adapter (BOA) mediates between object implementations and ORB

<table>
<thead>
<tr>
<th>CORBA::ORB</th>
</tr>
</thead>

<td>resolve_initial_references</td>
</tr>
<tr>
<td>get_default_context</td>
</tr>
<tr>
<td>create_environment</td>
</tr>
<tr>
<td>....</td>
</tr>
</tbody>
</table>
ORB Activation

**OR**B Activation

- **Client object**
  - ORB\_init
  - list\_initial\_services
  - resolve\_initial\_references

- **CORBA**
  - BOA\_init

- **ORB**
  - Initializes the mediator
  - Initializes the server BOA
  - Delivers service names (as strings)
  - Delivers object references to server objects from service names
Reflective calls

- Building a call object (Request)
- Adding arguments
- Invoking
- Polling, reading

```cpp
// dynamic call
create_list
create_operation_list
add_item
add_value
invoke
poll_response
send
get_response
delete
....
```

ORBs

► **Java-based**
  - IBM WebSphere
  - IONA Orbix: In Java, ORBlets possible
  - BEA WebLogic
  - Visibroker (in Netscape)
  - Voyager (ObjectSpace) (with Mobile Agents)
  - free: JacORB, ILU, Jorba, DynaORB

► **C-based**
  - ACE ORB TAO, University Washington (with trader)
  - Linux ORBIT (gnome)
  - Linux MICO

► **Python-based**
  - fnorb

► **http://www.omg.org**
22.3 Trader-Based Call

• The foundation of service-oriented architecture (SOA)
Beyond Dynamic Call: Service Call with the Trader Service

- A service call is a call, not based on naming but on semantic attributes, i.e., published properties
  - Requires a yellow page directory of services
- Service-oriented architectures (SOA) require matchmaking of services
  - The ORB resolves operations still based on naming (with the name service).
  - The trader resolves services without names, only based on properties and policies.
- The trader gets offers from servers, containing new services

![Diagram](image)

Mediator pattern, mediator lets clients lookup services
Service Offers for Trader

- **Service offer**
  - Properties describe services
  - Are used by traders to match services to queries
  - *not* facet-based, one-dimensional

- **Dynamic property**
  - A property can be queried dynamically by the trader
  - The service-object can determine the value of a dynamic property

- **Matching with the standard constraint language**
  - Boolean expressions about properties
  - Numeric and string comparisons
Interfaces Trading Service

- Basic interfaces
  - Lookup (query)
  - Register (for export, retract, import of services)
  - Admin (info about services)
  - Link (construction of trader graph)

- Unfortunately, no faceted matchmaking possible!
22.4 Evaluation of CORBA

• as composition system
Component Model

- Mechanisms for secrets and transparency: very good
  - Interface and Implementation repository
  - Component language hidden (interoperability)
  - Life-time of service hidden
  - Identity of services hidden
  - Location hidden

- No parameterization

- Standardization: quite good!
  - Services, application services are available
  - On the other hand, some standards are FAT
  - Technical vs. application specific vs business components:
  - .. but for business objects, the standards must be extended (vertical facilities) (that’s where the money is)
Composition Technique

Mechanisms for connection
- Mechanisms for adaptation
  - Stubs, skeletons, server adapters
- Mechanisms for glueing: marshalling based on IDL

Mechanisms for aspect separation
- Multiple interfaces per object
  - Facade classes/objects (design pattern facade)

Mechanisms for meta-modeling
- Interface Repositories with type codes
- Implementation repositories
- Dynamic call and traded call are reflective and introspective

Scalability
- Connections cannot easily be exchanged (except static local and remote call)
Composition Language

Weak: CORBA scripting provides a facility to write glue code, but only black-box composition
What Have We Learned

- CORBA is big, but universal:
  - The CORBA-interfaces are very flexible, work and can be used in practice
  - ... but also complex and fat, may be too flexible
  - If you have to connect to legacy systems, CORBA works
- CORBA has the advantage of being an open standard
- To increase reuse and interoperability in practice, one has to learn many standards
- Trading and dynamic call are advanced communication mechanisms
- CORBA was only the first step, web services the second
The End
22.5 Appendix

(self study)
Basic Composition Technique of CORBA (Basic CORBA Connections)
Static CORBA Call, Local or Remote

- Advantage: methods of the participants are statically known
  - Indirect call by stub and skeletons, without involvement of an ORB
  - Supports distribution (exchange of local call in one address space to remote call is very easy)
    - Inherit from CORBA class
    - Write an IDL spec
  - No search for service objects, rather fast
  - Better type check, since the compiler knows the involved types
- The call goes through the server object adapter (server decorator)
  - Basic (server) object adapter (BOA)
  - Portable (server) object adapter (POA)
  - This hides whether the server is transient or persistent
The CORBA Outer Skeleton: Basic Object Adapter BOA

- The BOA is a real adapter (no decorator)
  - The BOA hides the life time of the server object (activation: start, stop)
    - Persistency
- The BOA is implemented in every ORB, for minimal service provision
- The BOA maintains an implementation repository (component registry)
- It supports non-object-oriented code

CORBA::BOA

create
get_id
dispose
set_exception
impl_is_ready
obj_is_ready
change_implementation
deactivate_impl
deactivate_obj
Server Site

(Outer Skeleton)

IDL-generated Skeleton

Network

upcalls
create
impl_is_ready
get_id
object_is_ready
deactivate_obj
deactivate_impl
Object Activation on the Server through a BOA

Server → object1 → object2 → CORBA::BOA

- `create`
- `obj_is_ready`
- `impl_is_ready`
- `deactivate_obj`
- `deactivate_impl`

- `get_id`
- `obj_is_ready`
- `deactivate_obj`
Portable Object Adapter POA

The POA is a evolution of the BOA in CORBA 3.0
- One per server, serving many objects
- Nested POAs possible, with nested name spaces

User policies for object management
- User-written instance managers for management of object instances

<table>
<thead>
<tr>
<th>CORBA::POA</th>
</tr>
</thead>
<tbody>
<tr>
<td>create_POA</td>

</tr>
<tr>
<td>change_implementation</td>
</tr>
<tr>
<td>activate_object</td>
</tr>
<tr>
<td>deactivate_object</td>
</tr>
</tbody>
</table>
Object Adapters Support Different Server Life-Time Models

- **Common server process (shared server)**
  - Several objects reside in one process on the server; the BOA initializes them as threads with common address space (common apartment)
    - deactivate_impl, impl_is_ready, obj_is_ready are mapped directly to thread functions

- **Separate server process (unshared server)**
  - For every object an own process

- **Server-per-request (session server)**
  - Every request generates a new process
  - Similar to Session EJB

- **Persistent server**
  - Another application stores the objects (e.g., a data base).
  - The BOA passes on the queries
  - Similar to Entity Bean
The Callback pattern is a simplified Observer pattern
- Registration and notification, but not status update

Callback function registration
- Register a procedure variable, a closure (procedure variable with arguments), or a reference to an object at the subject, the server

Callback works for all languages, not only object-oriented ones
Event Connections

- Most flexible way of communication (also called messages)
  - Asynchronous communication
  - Works for every CORBA language

- Receiver models
  - **Unicast**: one receiver
  - **Multicast**: many receivers
  - **Dynamically** varying receivers

- **Push model**: PushConsumer/PushSupplier: object delivers event with push, event is shipped automatically

- **Pull model**: PullSupplier/PullConsumer: object waits for event with pull
  - Synchronous or asynchronous
  - Untyped generic events, or typed by IDL

- **Event channels** as intermediate buffers
  - Channels buffer, filter, and map of pull to push
  - Advantage:
    - Asynchronous Working in the Web (with IIOP and dynamic Call)
    - Attachment of legacy systems interesting for user interfaces, network computing etc.
  - Disadvantage: Very general interface
Appendix
Dynamic Call Connector (with Object Request Broking)

• Code example (self study)
// Wow, a complex protocol!!

CORBA::ORB_ptr orb;
main(int argc, char* argv[]) {
    orb= CORBA::ORB_init(argc,argv, ORBID);
    // alternative description of service
    CosNaming::NamingContext_ptr naming= CosNaming::NamingContext::_narrow(
        ::resolve_initial_references("NameService"));
    CORBA::Object_ptr obj;
    try {
        obj= naming->resolve(mk_name("dii_smpl"));
    } catch (CORBA::Exception) {
        cerr << "not registered" << endl; exit(1); }

    // make request (short form)
    CORBA::Request_ptr rq= obj->_request("op");
    // create argument list
    rq->arguments() = orb->create_list();
    rq->arguments()->add_value("arg1",val1,CORBA::ARG_IN);
    rq->arguments()->add_value("arg2",val2,CORBA::ARG_OUT);
    rq->arguments()->add_value("arg3",val3,CORBA::ARG_INOUT);
    // start request (synchronously)
    cout << "start request" << endl;

    rq->invoke();
    // analyze result
    CORBA::Short rslt;
    if (*rq->result()->value() >>= rslt) {
        // analyze the out/inout-parameters (arg1 has index 0)
        CORBA::Short _arg2, _arg3;
        *(rq->arguments()->item(1)->value()) >>= _arg2;
        *(rq->arguments()->item(2)->value()) >>= _arg3;
        cout << " arg2= " << _arg2 << " arg3= " << _arg3
             << " return= " << rslt << endl;
    } else {
        cout << "result has unexpected type" << endl;
    }

    // construct arguments
    CORBA::Any val1; val1 <<= (CORBA::Short) 123;
    CORBA::Any val2; val2 <<= (CORBA::Short) 0;
    CORBA::Any val3; val3 <<= (CORBA::Short) 456;
// Client.java
// Building Distributed Object Applications with CORBA
// Infowave (Thailand) Co., Ltd.
// http://www.waveman.com
// Jan 1998

public class Client {
    public static void main(String[] args) {
        if (args.length != 2) {
            System.out.println("Usage: vbj Client <carrier-name> <aircraft-name>");
            return;
        }
        String carrierName = args[0];
        String aircraftName = args[1];
        org.omg.CORBA.Object carrier = null;
        org.omg.CORBA.Object aircraft = null;
        org.omg.CORBA.ORB orb = null;
        try {
            orb = org.omg.CORBA.ORB.init(args, null);
        }
        catch (org.omg.CORBA.systemsxception se) {
            System.err.println("ORB init failure " + se);
            System.exit(1);
        }
DII Invocation in Java (2)

```java
{ // scope
    try {
        carrier = orb.bind("IDL:Ship/AircraftCarrier:1.0",
                         carrierName, null, null);
    } catch (org.omg.CORBA.systemsxception se) {
        System.err.println("ORB init failure " + se);
        System.exit(1);
    }

    org.omg.CORBA.Request request = carrier._request("launch");
    request.add_in_arg().insert_string(aircraftName);
    request.set_return_type(orb.get_priwithive_tc(
        org.omg.CORBA.TCKind.tk_objref));
    request.invoke();
    aircraft = request.result().value().extract_Object();
}

{ // scope
    org.omg.CORBA.Request request = aircraft._request("codeNumber");
    request.set_return_type(orb.get_priwithive_tc(
        org.omg.CORBA.TCKind.tk_objref));
    request.invoke();
    String designation = request.result().value().extract_string();
    System.out.println("Aircraft " + designation + " is coming your way");
}
```
Server Implementation

public class Server {
    public static void main(String[] args) {
        org.omg.CORBA.ORB orb = null;
        try {
            orb = org.omg.CORBA.ORB.init(args, null);
        } catch (org.omg.CORBA.systemException se) {
            System.err.println("ORB init failure " + se);
            System.exit(1);
        }

        org.omg.CORBA.BOA boa = null;
        try {
            boa = orb.BOA_init();
        } catch (org.omg.CORBA.systemException se) {
            System.err.println("BOA init failure " + se);
            System.exit(1);
        }

        Ship.AircraftCarrier carrier =
            new AircraftCarrierImpl("Nimitz");

        try {
            boa.obj_is_ready(carrier);
        } catch (org.omg.CORBA.systemException se) {
            System.err.println("Object Ready failure " + se);
            System.exit(1);
        }

        System.out.println(carrier + " ready for launch !!!");

        try {
            boa.impl_is_ready();
        } catch (org.omg.CORBA.systemException se) {
            System.err.println("Impl Ready failure " + se);
            System.exit(1);
        }
    }
}
Example: Time Server in Java

- On one machine; 2 address spaces (processes)
- Call provides current time
- Contains
  - IDL
  - Server
    - Starts ORB
    - Initializes Service
    - Gives IOR to the output
  - Client
    - Takes IOR
    - Calls service

```java
// TestTimeServer.idl

module TestTimeServer{
  interface ObjTimeServer{
    string getTime();
  }
};
```
// TestTimeServerImpl.java - Server Skeleton
import CORBA.*;
class ObjTestTimeServerImpl extends TestTimeServer.ObjTimeServer_Skeleton { // generated from IDL
  // Variables
  // Constructor
  // Method (Service) Implementation
  public String getTime() throws CORBA.SystemException {
    return "Time: " + currentTime;
  }
};
// TimeServer_Server.java
import CORBA.*;
public class TimeServer_Server{
public static void main(String[] argv){
    try {
        CORBA.ORB orb = CORBA.ORB.init();
        ...
        ObjTestTimeServerImpl obj =
            new ObjTestTimeServerImpl(...);
        ...
        System.out.println(orb.object_to_string(obj));
    } catch (CORBA.SystemException e){
        System.err.println(e);
    }
}
};
// TimeServer_Client.java
import CORBA.*;
public class TimeServer_Client{
    public static void main(String[] argv){
        try {
            CORBA.ORB orb= CORBA.ORB.init();
            ...
            CORBA.object obj = orb.string_to_object(argv[0]);
            ...
            TestTimeServer.ObjTimeServer timeServer =
                TestTimeServerImpl.ObjTimeServer_var.narrow(obj);
            ...
            System.out.println(timeServer.getTime());
        }
        catch (CORBA.SystemException e){
            System.err.println(e);
        }
    }
}
// starting server

Time: 14:35:44
Appendix
Corba Services

• (optional material)
Literature

- OMG. CORBA services: Common Object Service Specifications.
Overview on Corba Services

- Services provide functionality a programming language might not provide (e.g., Cobol, Fortran)
- 16+ standardized service interfaces (i.e., a library)
  - Standardized, but status of implementation different depending on producer
- Object services
  - Deal with features and management of objects
- Collaboration services
  - Deal with collaboration, i.e., object contexts
- Business services
  - Deal with business applications
- The services serve for standardization. They are very important to increase reuse.
  - Remember, they are available for every language, and on distributed systems!
Object Services: Rather Simple

- **Name service (directory service)**
  - Records server objects in a simple tree-like name space
  - (Is a simple component system itself)
- **Lifecycle service (allocation service)**
  - Not automatic; semantics of deallocation undefined
- **Property service (feature service for objects)**
- **Persistency service (storing objects in data bases)**
- **Relationship service to build interoperable relations and graphs**
  - Support of standard relations reference, containment
  - Divided in standard roles contains, containedIn, references, referenced
- **Container service (collection service)**
Collaboration Services

Communication services
- Resemble connectors in architecture systems, but cannot be exchanged to each other
  - Event service
    - push model: the components push events into the event channel
    - pull model: the components wait at the channel and empty it
  - Callback service

Parallelism
- Concurrency service: locks
- Object transaction service, OTS: Flat transactions on object graphs
  - Nested transactions?
Business Services

- **Trader service**
  - Yellow Pages, localization of services

- **Query service**
  - Search for objects with attributes and the OQL, SQL (ODMG-93)

- **Licensing service**
  - For application providers (application servers)
  - License managers

- **Security service**
  - Use of SSL and other basic services
Dependencies Between the Services
Example: CORBA Interoperable Object Reference – IOR

- A unique key for an object
  - Uniquely mapped per language (for all ORBs)
  - Hides object references of programming languages
- Consists of:
  - Type name (code), i.e., index into Interface Repository
  - Protocol and address information (e.g., TCP/IP, port #, host name), could support more than one protocol
  - Object key:
    - Opaque data only readable by generating ORB (pointer)
    - Object decorator (adapter) name (for BOA)
IOR Example

Component-Based Software Engineering (CBSE)
Object Services: Names

- Binding of a name associates a name to an object in a name space (directory, scope, naming context)
  - A name space is an associative array with a set of bindings of names to values
  - Namespaces are recursive, i.e., they can reference each other and build name graphs
  - Others: Active Directory, LDAP

- The representation of a name is based on abstract syntax, not on the concrete syntax of an operating system or URL.
  - A name consists of a tuple \((\text{Identifier}, \text{Kind})\).
  - The identifier is the real name, the Kind tells how the name is represented (e.g., c_source, object_code, executable, postscript, ...).
  - For creation of names there is a library (design pattern Abstract Factory).
Name Service CosNaming

        f.pack();
        f.show();
    }
}
Object Services: Persistency

- Definition of a Persistent Object Identifier (PID)
  - references the *value* of CORBA-objects (in contrast to a CORBA-object)

- Interface
  - connect, disconnect, store, restore, delete

- Attachment to data bases possible (also ODMG compatible)
Object Services: Property Service

- Management of lists of features (properties) for objects
  - Properties are strings
  - Dynamically extensible
- Concept well-known as
  - LISP property lists, associative arrays, Java property classes
- Iterators for properties
- Interface:
  - define_property, define_properties, get_property_value, get_properties, delete_property,
Collaboration Services: Transactions

- What a dream: the Web as database with nested transactions. Scenarios:
  - Accounts as Web-objects. Transfers as Transaction on the objects of several banks
  - Parallel working on web sites: how to make consistent?

- Standard 2-phase commit protocol:
  - begin_ta, rollback, commit

- Nested transactions
  - begin_subtransaction, rollback_subtransaction, commit_subtransaction
Appendix
CORBA Facilities
(Standards for Application Domains)
Horizontal Facilities

Component-Based Software Engineering (CBSE)

- **User interfaces**
  - Printing, Scripting
  - Compound documents: since 1996 OpenDoc is accepted as standard format. Source Code has been released of IBM

- **Information management**
  - Metadata (meta object facility, MOF)
  - Tool interchange: a text- and stream based exchange format for UML (XMI)
  - Common Warehouse Model (CWM): MOF-based metaschema for database applications
Vertical Facilities
(Domain-Specific Facilities)

- The Domain technology committee (DTC) creates domain task forces DTF for an application domain
  - Business objects
  - Finance/insurance
    - Currency facility
  - Electronic commerce
  - Manufacturing
    - Product data management enablers PDM
  - Medicine (healthcare CorbaMed)
    - Lexicon Query Service
    - Person Identifier Service PIDS
  - Telecommunications
    - Audio/visual stream control object
    - Notification service
  - Transportation
Since 2000, the OMG describes domain-specific vocabularies with UML profiles
- Probably, all CORBA facilities will end up in UML profiles

A UML Profile is a UML dialect of an application specific domain
- With new stereotypes and tagged values
- Corresponds to an extension of the UML metamodel
- Corresponds to a domain specific language with own vocabulary
- Every entry in profile is a term

Example UML Profiles:
- EDOC Enterprise Distributed Objects Computing
- Middleware profiles: Corba, .NET, EJB
- Embedded and real time systems:
  - MARTE profile on schedulability, performance, time
  - Ravenscar Profile
  - HIDOORS Profile on real-time modelling www.hidoors.org
Appendix

CORBA and the Web
Corba and the Web

- HTML solves many of the CORBA problems
- HTTP only for data transport
  - HTTP cannot call methods, except by CGI-Gateway-functionality (common gateway interface)
  - Behind the CGI-interface is a generals program, communicating with HTTP with untyped environment variables (HACK!)
  - http-Server are simple ORBs, pages are objects
  - The URI/URL-name schema can be integrated into CORBA

- IIOP becomes a standard internet protocol
  - Standard ports, URL-mappings and Standard-proxies for Firewalls are available

- CORBA is an extension of HTTP of data to code
CORBA and Java

Java is an ideal partner for Corba:
- Bytecode is mobile, i.e.,
  - Applets: move calculations to clients (thin/thick client problem)
  - can be used for migration of objects, ORBs and agents
- Since 1999 direct Corba support in JDK 1.2
  - IDL2Java mapping, IDL compiler, Java2IDL compiler, name service, ORB
- Corba supports for Java a distributed interoperable infrastructure

Java imitates functionality of Corba
- Basic services: Remote Method Invocation RMI, Java Native code Interface JNI
- Services: serialization, events
- Application specific services (facilities): reflection, properties of JavaBeans
Corba and the Web (Orblets)

- ORBs can be written as bytecode applets if they are written in Java (ORBlet).
- Coupling of HTTP and IIOP: Download of an ORBlets with HTTP: Talk to this ORB, to get contact to server.
- Standard web services (see later) are slower than CORBA/ORBlets, because they incur interpretation overhead.

![Diagram of Orblets and web interactions]

1) Fetch page
2) fetch ORBlet
3) communicate with IIOP
