Last Week

2 Academic Skills in Software Engineering (ASiSE)

Any Questions?

Agenda

- LaTeX – Some further hints ...
- BibTeX and biblatex – Some further hints ...
- Figures and Diagrams – Handling figures in LaTeX
- Lyx – A WYSIWYM-Frontend for LaTeX

Last Week

- [1] LaTeX @ WikiBooks
<http://en.wikibooks.org/wiki/LaTeX/>
 - [2] LaTeX Page Styles
<http://www.personal.ceu.hu/tex/pagestyl.htm>
 - [3] Carsten Heinz, Brooks Moses: The Listings Package
<ftp://ftp.tex.ac.uk/tex-archive/macros/latex/contrib/listings/listings.pdf>

Some further hints

Information Sources for LaTeX

6 Academic Skills in Software Engineering (ASiSE)

- ▶ Information about all packages:
texdoc <packagename>
- ▶ TU Corporate Design documentation (German only)
texdoc tudscr
- ▶ Guidelines for Scientific Writing with LaTeX (German only)
texdoc treatise

Recommended packages: see **texdoc treatise**

- ▶ tex.stackexchange.com
beware of outdated information!

LaTeX and Character Encoding

- ▶ Character encoding problems can be avoided with Unicode Versions of LaTeX:

- ▶ XeTeX
 - All input is UTF-8
 - Developed for non-latin character sets

- ▶ LuaTeX
 - Similar to XeTeX, but with Lua scripting support

\begin{luacode}

...

\end{luacode}

\directlua{ ... }

Page Numbering

Specify the **style of page numbers**

```
\pagenumbering{arabic}
```

- arabic: Arabic numerals (1, 2, 3, ...)
- roman: Lowercase roman numerals (i, ii, iii, iv, ...)
- Roman: Uppercase roman numerals (I, II, III, IV, ...)
- alph: Lowercase letters (a, b, c, ...)
- Alph: Uppercase letters (A, B, C, ...)

You can even **use multiple styles** within the same document

Listings

```
\usepackage{lstlistings} Package import in preamble!  
  
\lstset{language=Java} Language for syntax highlighting  
\begin{lstlisting}[label={list1},caption={Listing  
Caption}]  
public class Main {  
    public static void main(String[] args) {  
        System.out.println("Hello World");  
    }  
}  
\end{lstlisting}
```

LaTeX2PDF Compiler

```
public class Main {  
    public static void main(String[] args) {  
        System.out.println("Hello World");  
    }  
}
```

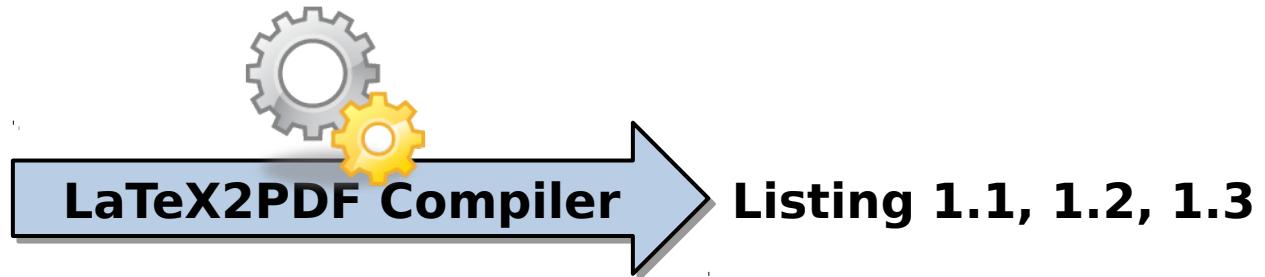

Listings - \lstset

- Configures **appearance**
- Can be used
 - In the **preamble**
 - **In front of each listing**
 - Or both
 - Latest configs are valid
- `\lstset{language=Java}`

Listings – Number by Chapter

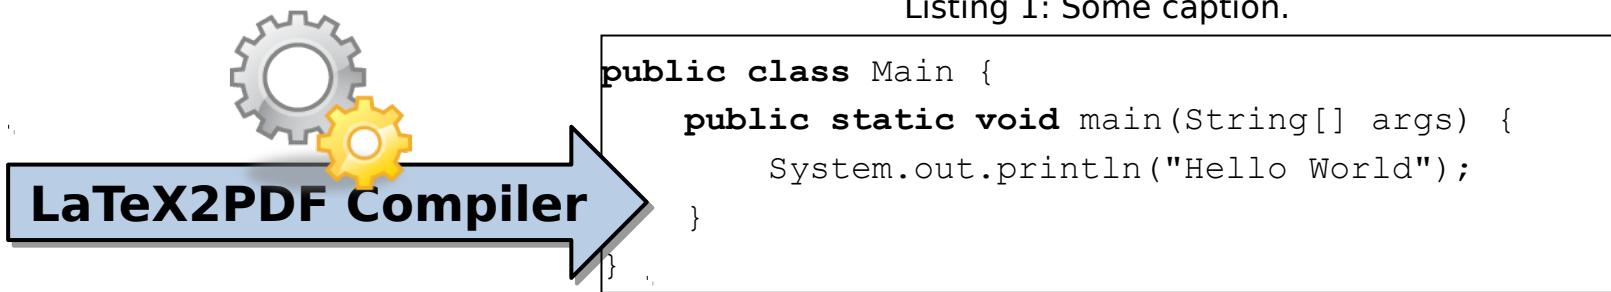

- If each chapter shall have its own Listings:

```
\lstset{numberbychapter = true}
```

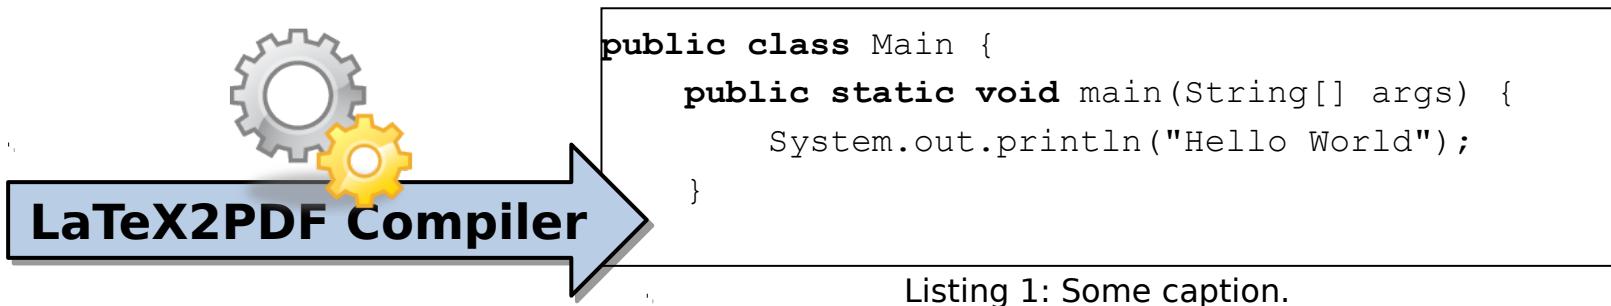

Listings – Position of Caption

- `\lstset{captionpos = t}` (**default**)

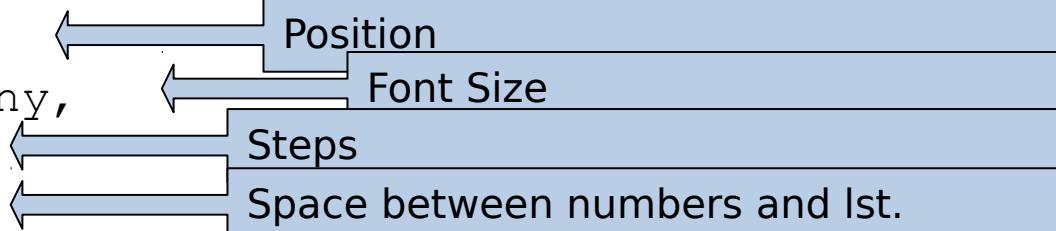

- `\lstset{captionpos = b}`

Listings – Line Numbers

```
\lstset{
    numbers=left,
    numberstyle=\tiny,
    stepnumber=2,
    numbersep=5pt
}
```

```
1 public class Main {
2     public static void main(...) {
3         System.out.println("...");  
4     }
5 }
```

Listings – Line Numbers

- `\begin{lstlisting}[firstnumber=100]`

```
100 public class Main {  
101     public static void main(...) {  
102         System.out.println("...");  
103     }  
104 }
```

- `\begin{lstlisting}[firstnumber=last]`

```
105 public class Main {  
106     public static void main(...) {  
107         System.out.println("...");  
108     }  
109 }
```

Listings – Appearance of Code

```
\lstset{
    basicstyle=\small,
    keywordstyle=\color{black}\bfseries,
    identifierstyle=\color{blue},
    commentstyle=\color{white},
    stringstyle=\ttfamily,
    showstringspaces=false
}
```

```
public class Main {
    public static void main(String[] args) {
        System.out.println("Hello World");
    }
}
```

Listings – Syntax Highlighting

- `\lstset{language = Java}`
- **Sometimes insufficient, e.g., extensions like AspectJ**
- `\lstset{keywords = {public, class, aspect, pointcut, ...}}`
- **Or even better:**
- `\lstset{language = Java, morekeywords = {aspect, pointcut, ...}}`

Listings – Import of Listings

- For large listings, it's easier to import them as a whole file:
- `\lstset{language = Java}`
`\lstinputlisting{largeexample.java}`

Your Own Commands

- A typical useful command
(defined in header):

Placeholder for content.

```
% requires \usepackage{color}  
\newcommand{\todo}[1]  
  {\color{red}\textbf{TODO #1}\color{black}}  
}
```

- **Usage:**

Bla bla.\todo{Write something on X here.} Bla.

Bla bla. **TODO Write something on X here.** Bla.

LaTeX and Math

- One of the top most advantages of LaTeX are the **math packages**
- `\usepackage{mathtools}`
- In **text**, use the `$` delimiter:
$$4 * 3 = 12$$
- **Equations:**
`\begin{equation}
 4 * 3 = 12
 \label{equ1}
\end{equation}`
$$4 * 3 = 12$$

LaTeX and Math

- **Quantors [1]:**

\forall x \in X, \quad \exists y \leq \epsilon

$$\forall x \in X, \quad \exists y \leq \epsilon$$

- **Greek letters [1]:**

\alpha, \beta, \gamma, \Gamma, \pi, \Pi, \phi, \varphi, \Phi

$$\alpha, \beta, \gamma, \Gamma, \pi, \Pi, \phi, \varphi, \Phi$$

- **Fractions [1]:**

$$\frac{n!}{k!(n-k)!} = \binom{n}{k}$$

$$\frac{n!}{k!(n-k)!} = \binom{n}{k}$$

- **Sums [1]:**

$$\sum_{i=1}^{10} t_i$$

$$\sum_{i=1}^{10} t_i$$

Some further hints ...

BibLatex and Biber

23

Academic Skills in Software Engineering (ASiSE)

- ▶ Do not use Bibtex, it's outdated!
- ▶ Biggest Problem: no real unicode support!
- ▶ **Biber** with biblatex:
 - Biber is conceptually a BIBTEX replacement for Biblatex.[...] Functionally, Biber offers a superset of BIBTEX's capabilities [...]. Biber's primary role is to support Biblatex by performing the following tasks:
 - Parsing data from datasources
 - Processing cross-references, entry sets, related entries
 - Generating data for name, name list and name/year disambiguation
 - Structural validation according to Biblatex data model
 - Sorting reference lists
 - Outputting data to a .bbl for Biblatex to consume

[**texdoc biber**]

BibLatex and Biber

- ▶ Do NOT use Bibtex, it's outdated!
- ▶ Biber with **biblatex**:
 - *The package is a complete reimplementation of the bibliographic facilities provided by LaTeX. A custom backend Biber by default is used which processes the BibTeX format data files and them performs all sorting, label generation (and a great deal more). [texdoc biblatex]*
- ▶ \usepackage[backend=biber]{biblatex}
- ▶ Bibliography has the same format
- ▶ Call biber instead of biblatex

Bibliography

```
@INPROCEEDINGS{Reimann2012a,  
    author = {Reimann, Jan and Wilke, Claas and Demuth,  
              Birgit and Muck, Michael and Aßmann, Uwe},  
    title = {Tool Supported OCL Refactoring Catalogue}},  
    booktitle = {Workshop on OCL and Textual Modelling  
                (OCL 2012)},  
    year = {2012}  
}
```

Citation in document: \cite{Reimann2012a}

Printing the bibliography: \bibliographystyle{abbrv}

%myBib.bib contains the entries

```
\bibliography{myBib}
```

Bib(La)TeX Citations

Citation in document:

```
\cite{Rei2012}
```

[RWB+12] or [1]

Citation with page number:

```
\cite[pp. 1-3]{Rei2012}
```

[RWB+12, p. 1-3] or [1, p. 1-3]

Multiple citations:

```
\cite{Rei2012, Ass03, Ass04}
```

[RWB+12, Ass03, Ass04] or [1-3]

Kind of Citations

In `\cite{Rei2012}` and `\cite{Ass03}` ...

```
\bibliographystyle{abbrv}  
\bibliography{myBib}
```

Style

abbrv

alpha

unsrt

Appearance

In [2] and [1] ...

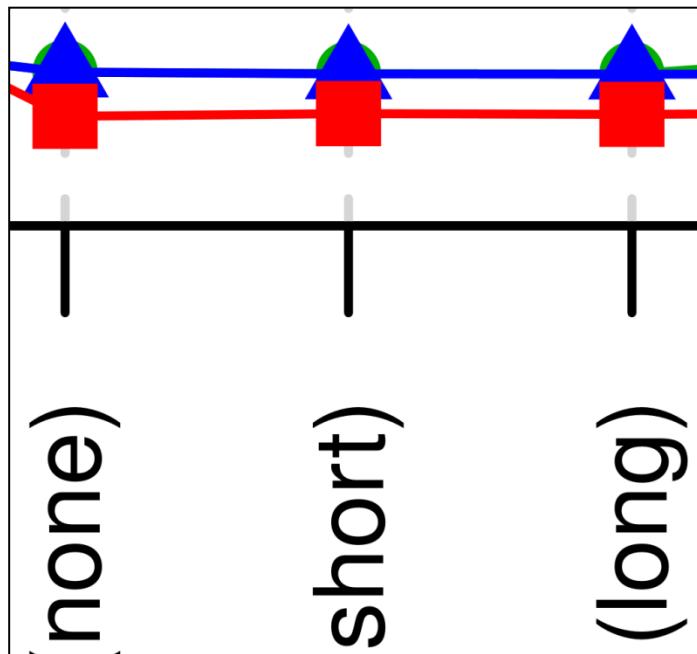

In [RWD+12] and [Aßm03] ...

In [1] and [2] ...

Handling Figures in LaTeX

Vector vs. Bitmap Graphics

Vector vs. Bitmap

- LaTeX **output is often released digitally**
 - **Users can zoom in!**
 - Use **vector graphics wherever possible**
 - Or use **high resolution bitmaps!**
- You can **export PDF files** from
 - Excel
 - PowerPoint
 - Inkscape
- Use **bitmaps only when necessary** (e.g. Screenshots)

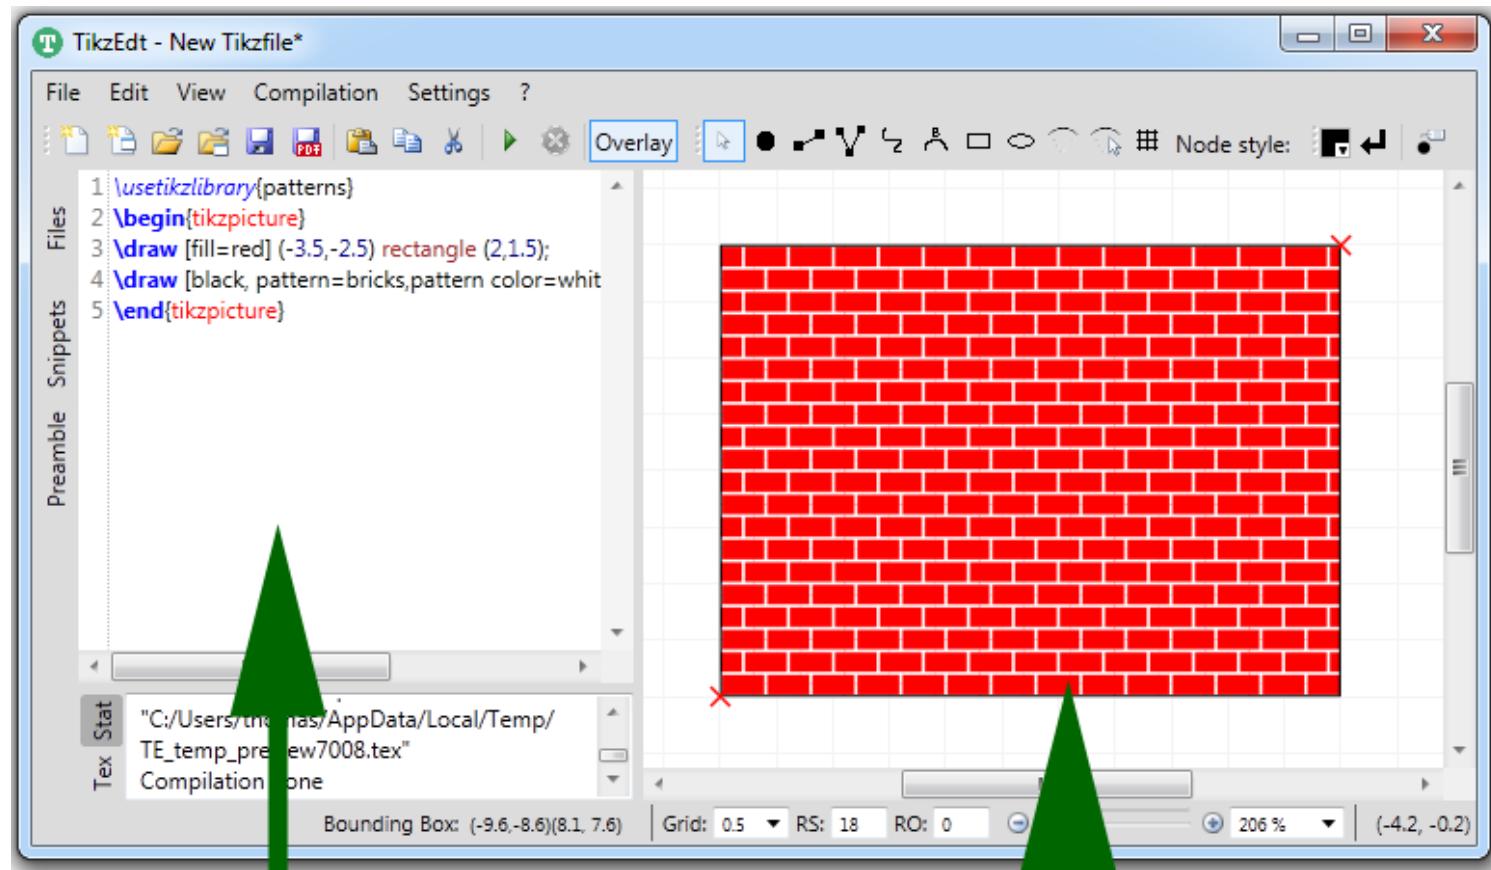

Diagrams in LaTeX

- TikZ and pgfplots
- PsTricks
 - Does not work with pdfLaTeX
 - Use package **auto-pst-pdf**

- ▶ Vector graphics drawn in LaTeX
 - **texdoc tikz**
 - Useful for drawing graphs
- ▶ Many packages for special diagram types
 - UML
 - Petri Nets
 - ...
- ▶ Plot graphs with pgfplots

TikZedt

- ▶ Arranging complicated, but a nice tool exists: tikzedt
- ▶ <http://www.tikzedt.org/>

A WYSIWYM Editor for LaTeX

- LaTeX is not a WYSIWYG-Editor (What you see is what you get)
 - Quasi-WYSIWYG
- Alternatively: WYSIWYM (What you see is what you mean)-Frontend
- LyX is a **WYSIWYM-Frontend for LaTeX**
 - Uses its own document format (*.lyx)
 - LyX-Code is compiled into LaTeX
→ LyX is a LaTeX precompiler
- <http://www.lyx.org/>

The screenshot shows the LyX application window. The title bar reads "LyX: ~\Documents\Neues_Dokument1.lyx (geändert)". The menu bar includes "Datei", "Bearbeiten", "Ansicht", "Einfügen", "Navigieren", "Dokument", "Werkzeuge", and "Hilfe". The toolbar contains various icons for document operations like saving, printing, and navigating. A "Gliederung" (Outline) panel on the left shows a tree structure with "1 Introduction", "1.1 First Section", and "1.2 Second Section". The main content area displays the following text:

1

Introduction

Some Text

1.1 First Section

Some Text

1.2 Second Section

Configuration of used document class

- (Document -> Settings / Dokumente Einstellung)
- **Easy moval** of whole **sections** and **paragraphs**
- **Easy work** with **multiple lyx files** (e.g. for each section/chapter)
- Integrated **spell checker**
- Integrated **change management**
- Integrated **formula editor**

The End

- ▶ Initial slide set was done by Claas Wilke
- ▶ Some contributions by Johannes Mey
