

# 13) The Tools And Materials Architectural Style and Pattern Language (TAM)

Prof. Dr. U. Aßmann  
Chair for Software Engineering  
Faculty of Informatics  
Dresden University of Technology  
11-0-1, 12/10/11

- 1) Tools and Materials - the metaphor
- 2) Tool construction
- 3) The environment
- 1) Material constraints
- 4) TAM and layered frameworks

3

# Contents

- ▶ The central metaphors of the Tools-and-Materials architectural style
- ▶ The concrete pattern language
- ▶ TORA case study
- ▶ TAM and layered frameworks

4

# Why Do People Prefer to Use certain Software Systems?

- ▶ People should feel that they are competent to do certain tasks
- ▶ No fixed workflow, but flexible arrangements with tools
  - Domain office software, interactive software
- ▶ People should decide on how to organize their work and environment
- ▶ People want to work incrementally, in piecemeal growth

5

## 13.1 Elements of “Tools and Materials”

6

# 13.1 The Central T&M Metaphor

- ▶ Tools and Materials pattern language T&M
  - Werkzeug und Material (WAM)
  - Central notions of craftsmanship
    - Craftsmen use tools to work on material
- ▶ People use tools **in their everyday work**
  - Tools are *means of work*
- ▶ People use tools to work on material
- ▶ T&M-collaborations
  - Tools and materials are in relation
  - ▶ Environment
  - Craftsmen work in an environment

7

## And 3-Tier Architectures?

- ▶ Another popular architectural style for interactive applications is 3-tier architecture
- ▶ However, the 3-tiers are so coarse-grained that they do not really help for interactive applications
- ▶ T&M is much more detailed

8

User Interface

Application logic

e

Data Handling

8

# Material

- ▶ Passive entities, either values or objects
  - Forms laid out on a desktop, entries in a database, items in a worklist
  - ▶ Prepared and offered for the work to be done
  - ▶ Transformed and modified during the work
  - ▶ Not directly accessible, only via tools
- ▶ Values (e.g., Dates, Money)
  - Without time and position
  - Abstract, without identity
  - Equality is on value
  - A value is defined or undefined, but immutable
  - Cannot be used in a shared way
  - Structured (then every subvalue has 1 reference), such as documents
  - are domain-specific, such as business values (value objects)
- ▶ Objects (e.g., Persons, technical objects, Bills, Orders)
  - With time and position
  - Concrete, with identity
  - Equality is on *names*
  - Mutable; identity does not change
  - Shared by references
  - Structured (a subvalue may have several references)

# Tools

- ▶ Active entities
  - Tools are means of work. They embody the experience of how to efficiently work with material
  - Present a view on the material. Visible on the desktop as wizards, active forms,...
  - Give feedback to the user
  - Have a state
- ▶ If well-designed, they are transparent and light-weight
  - However, they should not disappear, since users need to look at a tool if they are worried
- ▶ Examples:
  - Browser – Contents of a folder
  - Interpreter – Code and data
  - Calendar - Calendar data
  - Form editor - Form

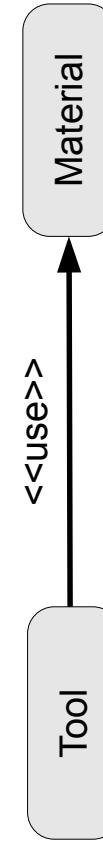

# Tools vs. Material

- ▶ To say, what is a tool and what the material, depends a lot on the concrete task (interpretation freedom)
  - Pencil — paper
  - Pencil sharpener - pencil
- ▶ Tools can be structured
  - Supertools and subtools, according to tasks and subtasks
    - e.g., Calendar = AppointmentLister + AppointmentEditor
  - We work with different tools on the same material
  - In implementations, tools are often realized as a variant of the Command pattern
    - They are reified actions
    - They have a function execute( )

11

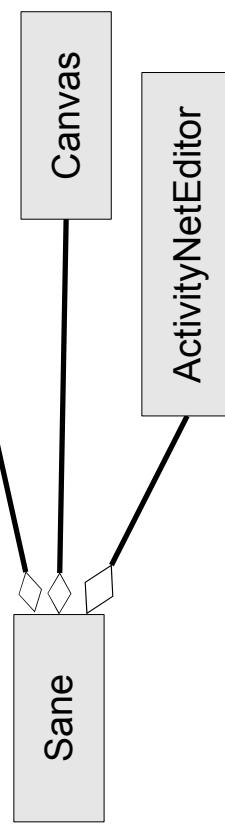

## Tools and Materials as Special Role Model

- ▶ The tool is active, has control
- ▶ The material is passive and hands out data

# Case Study: TORA Tool

- ▶ Tool for Task oriented requirements analysis (TORA)
  - Editor SANE for activity nets in requirements analysis
- ▶ TORA has subtools
  - Glossary browser Lexicon to manage glossaries about requirement specifications
  - Canvas for the editor's graphical objects. Manipulates the editor's visible materials (Graphical objects, GraphObj):
    - Edit shapes, icons, representation
    - Annotate activity nets
  - Activity net subtool for logical materials ActivityObj
    - An ActivityObj may have several visual rep [GraphObj]

13

## (Work-)Environment

- ▶ The (Work-)Environment to organize the tools, materials, and T&M-collaborations
  - Tools can be created from the environment by tool factories (Factory pattern)
  - Materials can be created from the environment by material factories
  - Corresponds to the metaphors of a workshop or desktop
    - ▶ Environment for planning, working, arranging, space
    - Several logical dimensions to arrange things

## 13.2 Tool Construction

### Tool-Material Collaboration Pattern

- A *tool-material collaboration* (T&M role model, T&M access aspect) expresses the relation of a tool and the material
  - Characterizes a tool in the context of the material
  - The material in the context of a tool
  - The tool's access of the material. The tool has a view on the material, several tools have different views
- More specifically:
  - A *role* of the material, in collaboration with a tool
    - An interface of the material, visible by a tool, for a specific task
    - An abstract class
  - Roles of a material define the necessary operations on a material for one specific task
    - They reflect usability: how can a material be used?
    - Express a tool's individual needs on a material

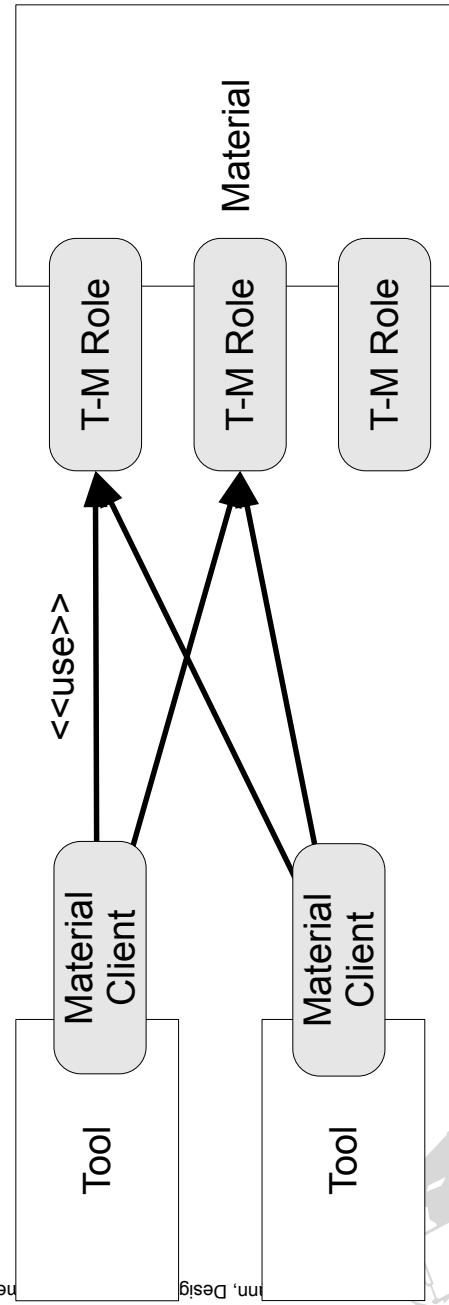

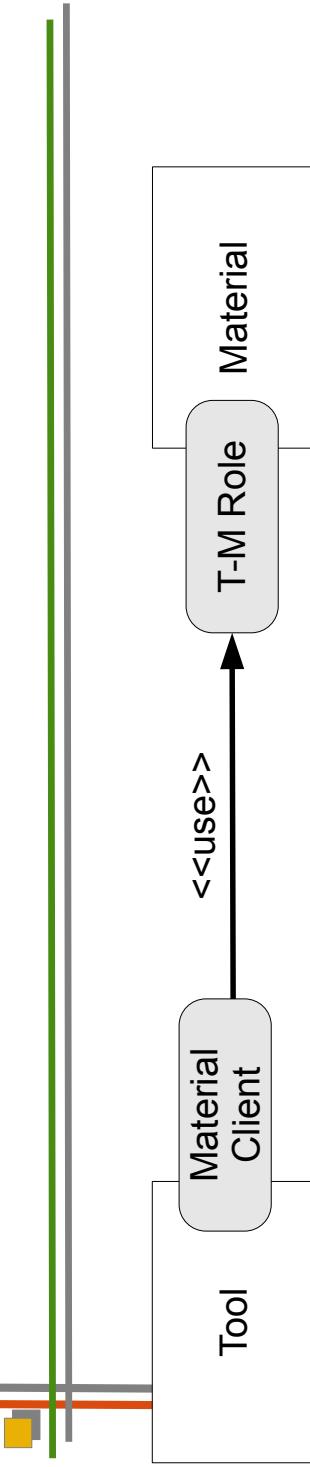

15

Design Patterns and Frameworks, © Prof. Uwe Alßmann

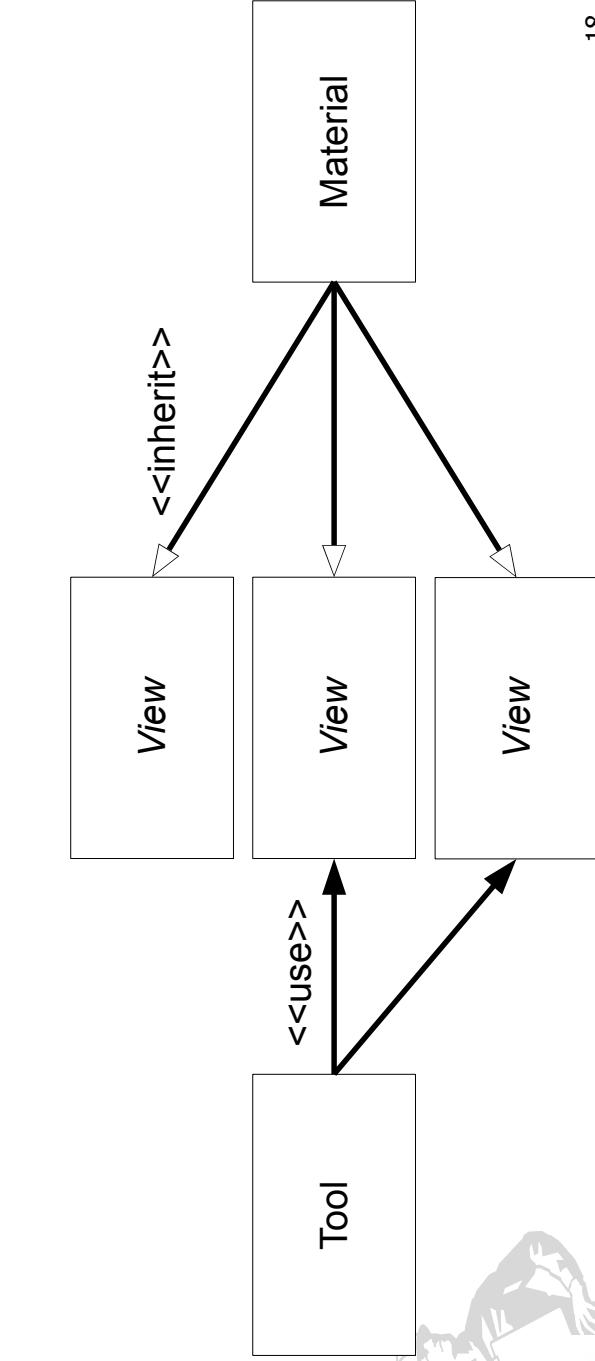

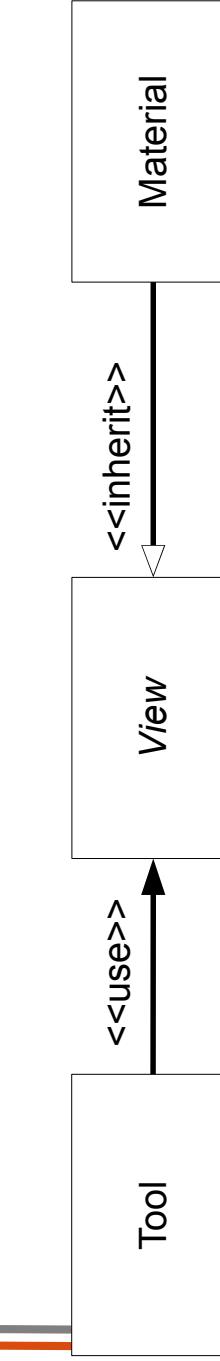

# Tools and Their Views on Material

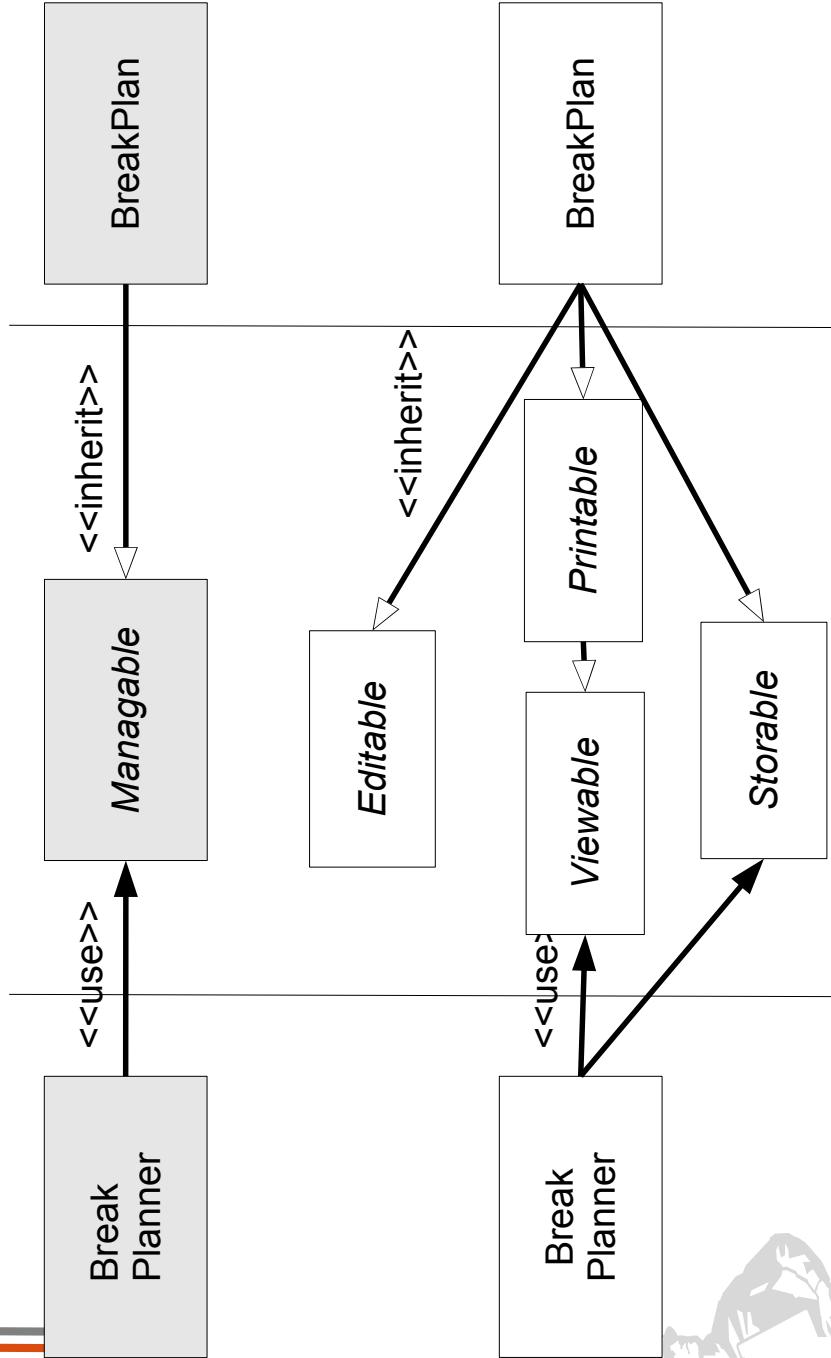

17

## Implementing Tool-Material Roles With Interfaces

18

# Tools/Views/Material with .able-Interfaces

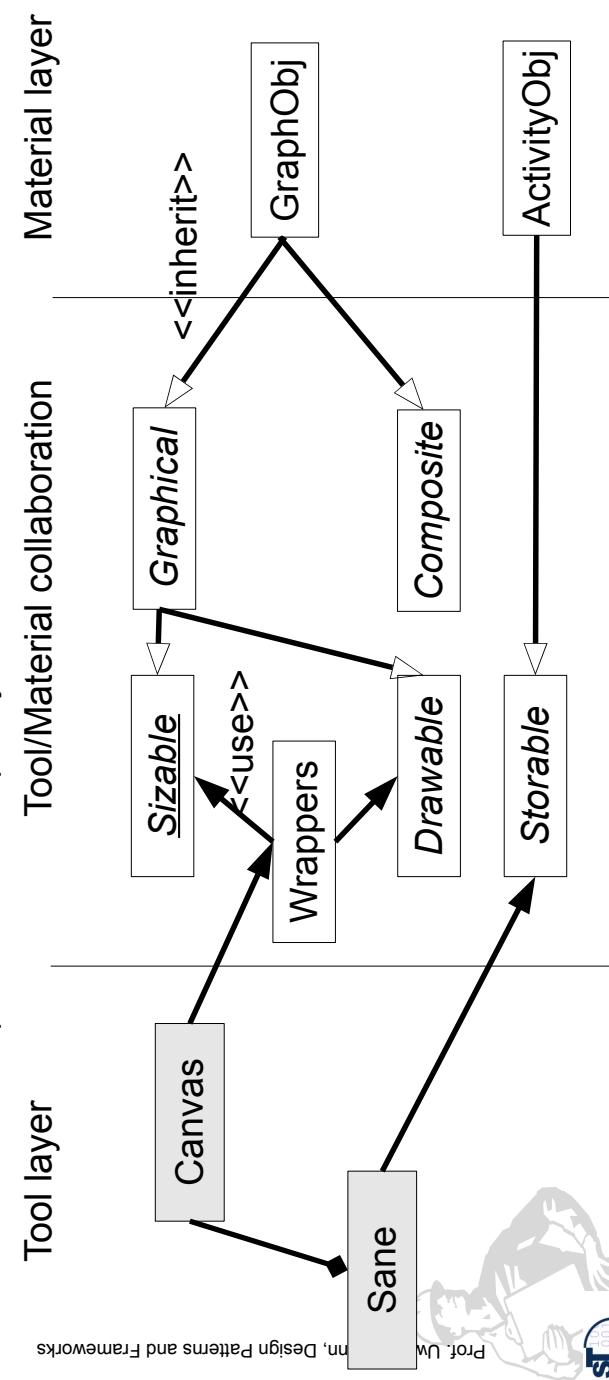

19

## Names of Roles

- ▶ The notion of a material-role helps a lot to understand the functionality of the materials
  - And helps to separate them
- ▶ Often a “adjectified verb”, such as Listable, Editable, Browsable, expresses the ability of a material from the perspective of a tool

# Access To Materials In TORA

- ▶ Access from tools to material via material-roles
  - Main tool: Storable
  - Canvas:
    - Drawable, Sizable with the help of wrappers DragWrapper, ResizeWrapper
    - Graphical role of GraphObj

21

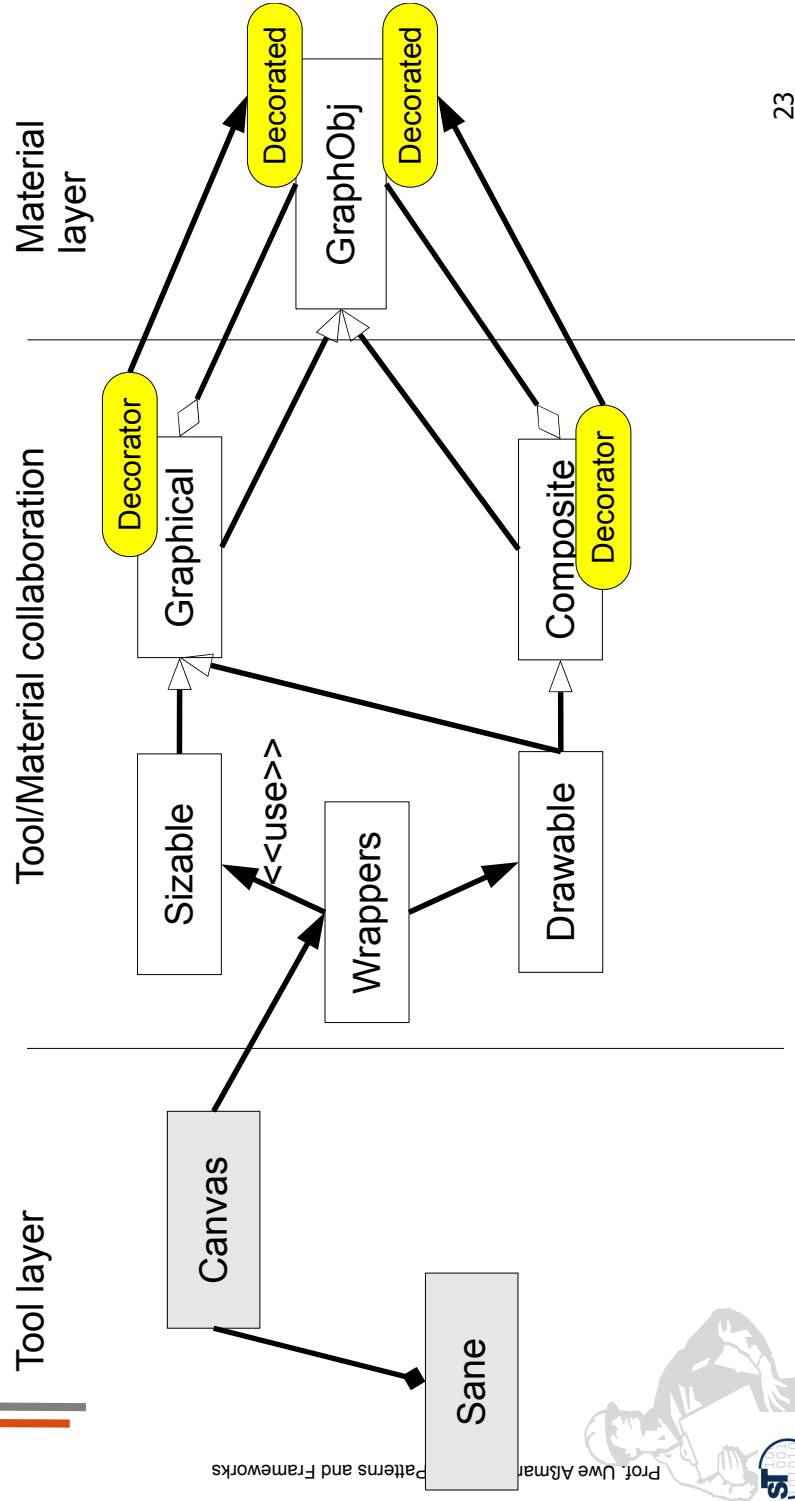

## Alternative Implementations of Tool-Material Collaboration

- ▶ See chapter on role implementation
  - Construction of roles by interfaces
  - By multiple or mixin inheritance
- ▶ By ObjectAdapter pattern
- ▶ By Decorator pattern
- ▶ By Role-Object Pattern
- ▶ By GenVoca Pattern

## Ex.: Tools Accessing Material Via Decorators

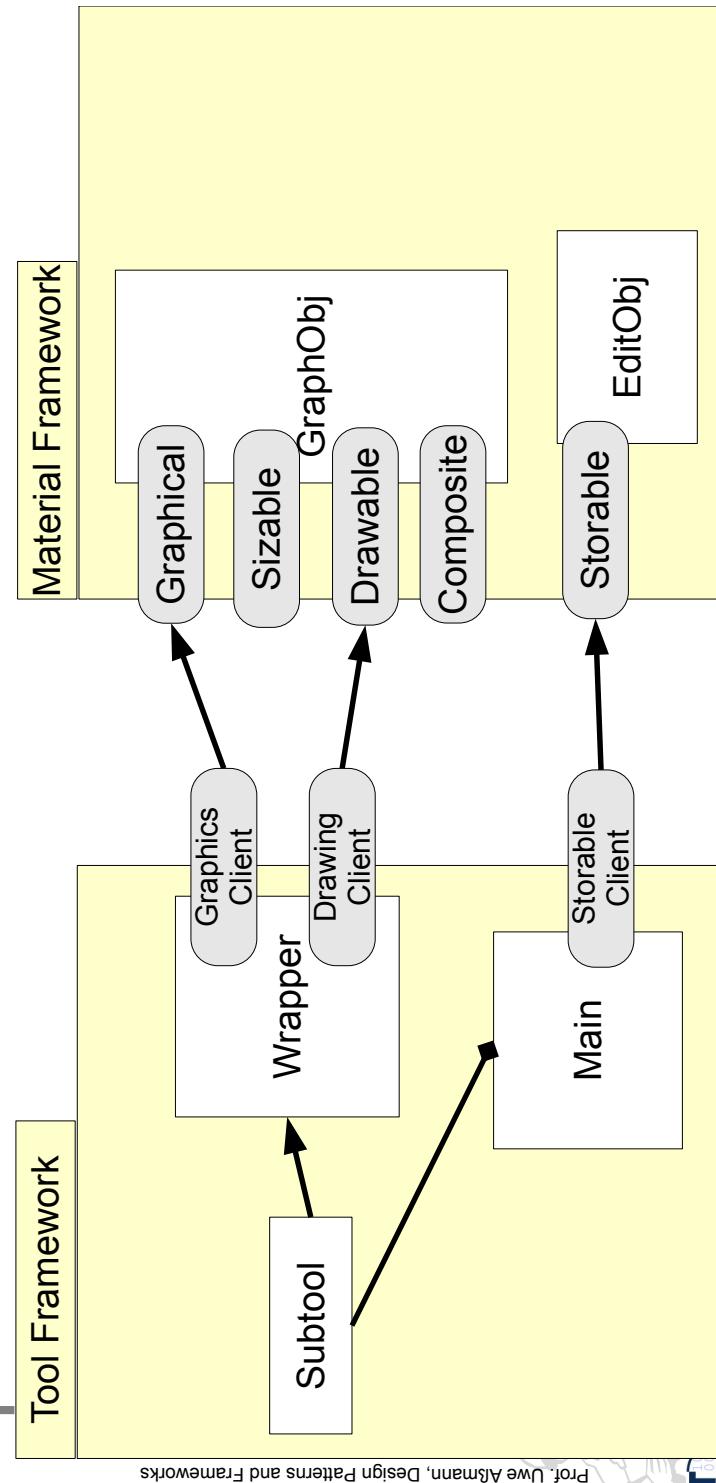

- ▶ Converting roles into decorator objects

23

## Composition of a Tool and a Material Framework With Collaboration Roles

- ▶ Since Material-roles are roles, Tool layer and Material layer can be modeled as frameworks (which then can be composed by role composition/use)

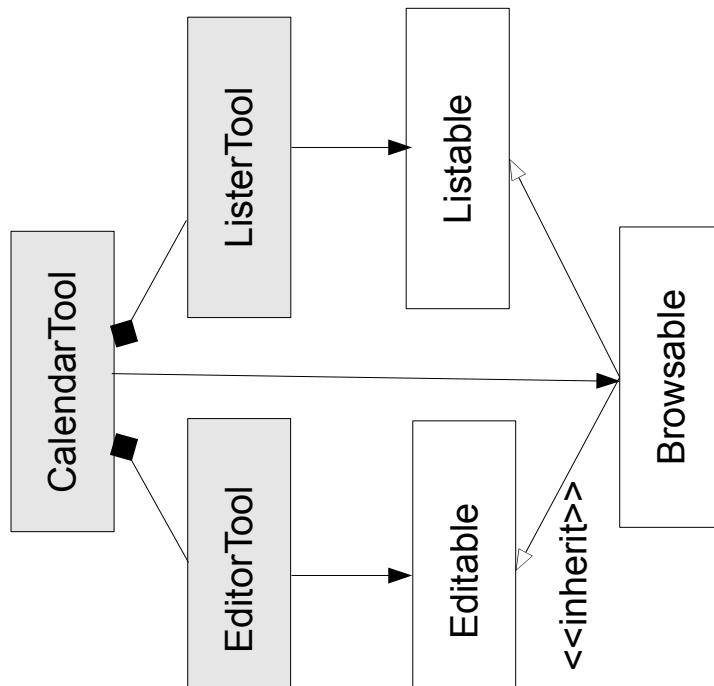

# Tool Construction: Structured Tool Pattern

- ▶ Structured tools
  - Atomic tools
  - Composed tools (with subtools)
    - Recursively composed tools (Composite pattern)
- ▶ Structured along the tasks
  - A complex tool creates, delegates to, and coordinates its subtools

25

# Tool Construction: Structured Tool Pattern

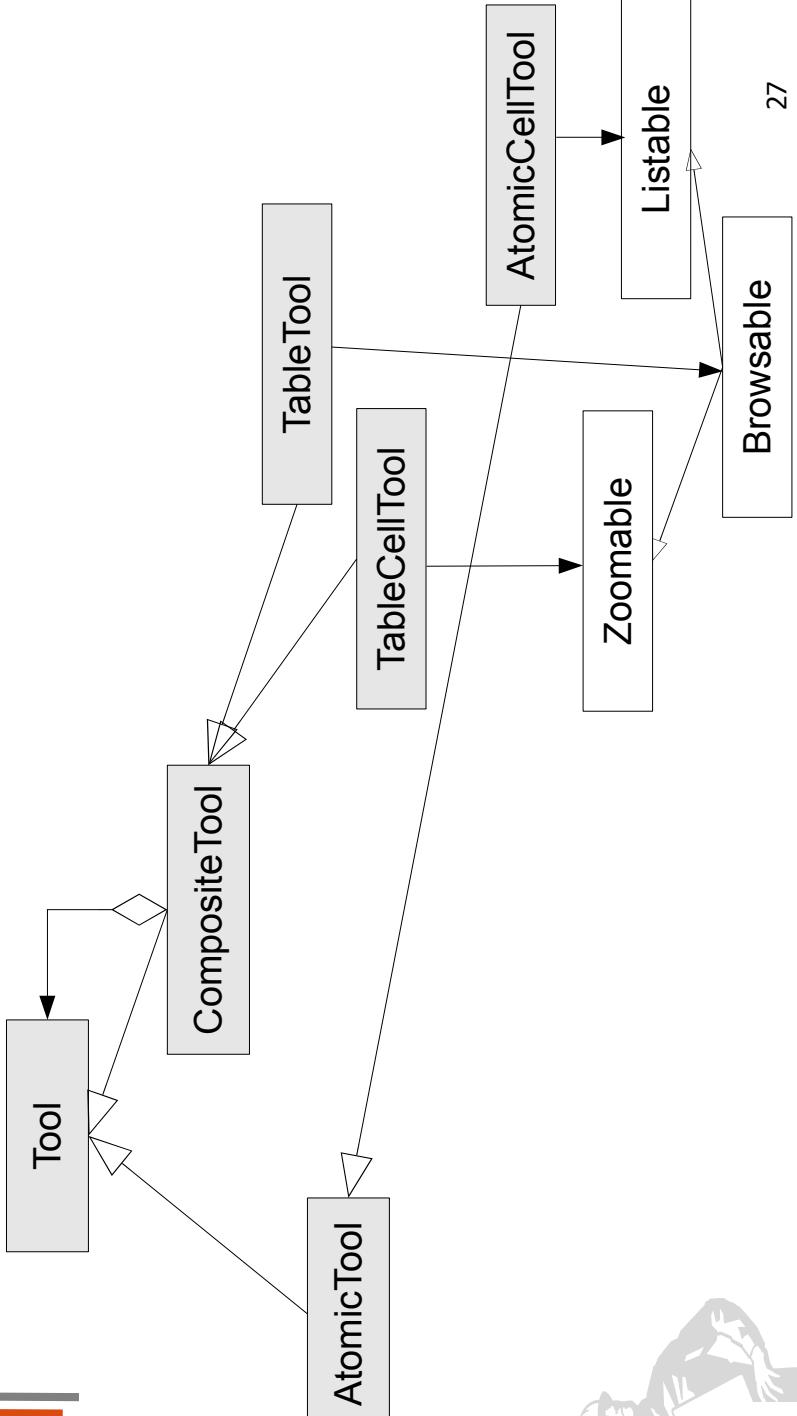

- ▶ A subtool can work on its own material
  - Or on the same material as a supertool, but with fewer or less complex roles
- ▶ Advantage: complex tools see complex roles, simple tools simple roles
- ▶ The role hierarchy opens features of the material only as needed (good information hiding)

26

# Tool Construction: Composite as Structured Tool Pattern

- The Composite pattern can be used to build up recursive tools

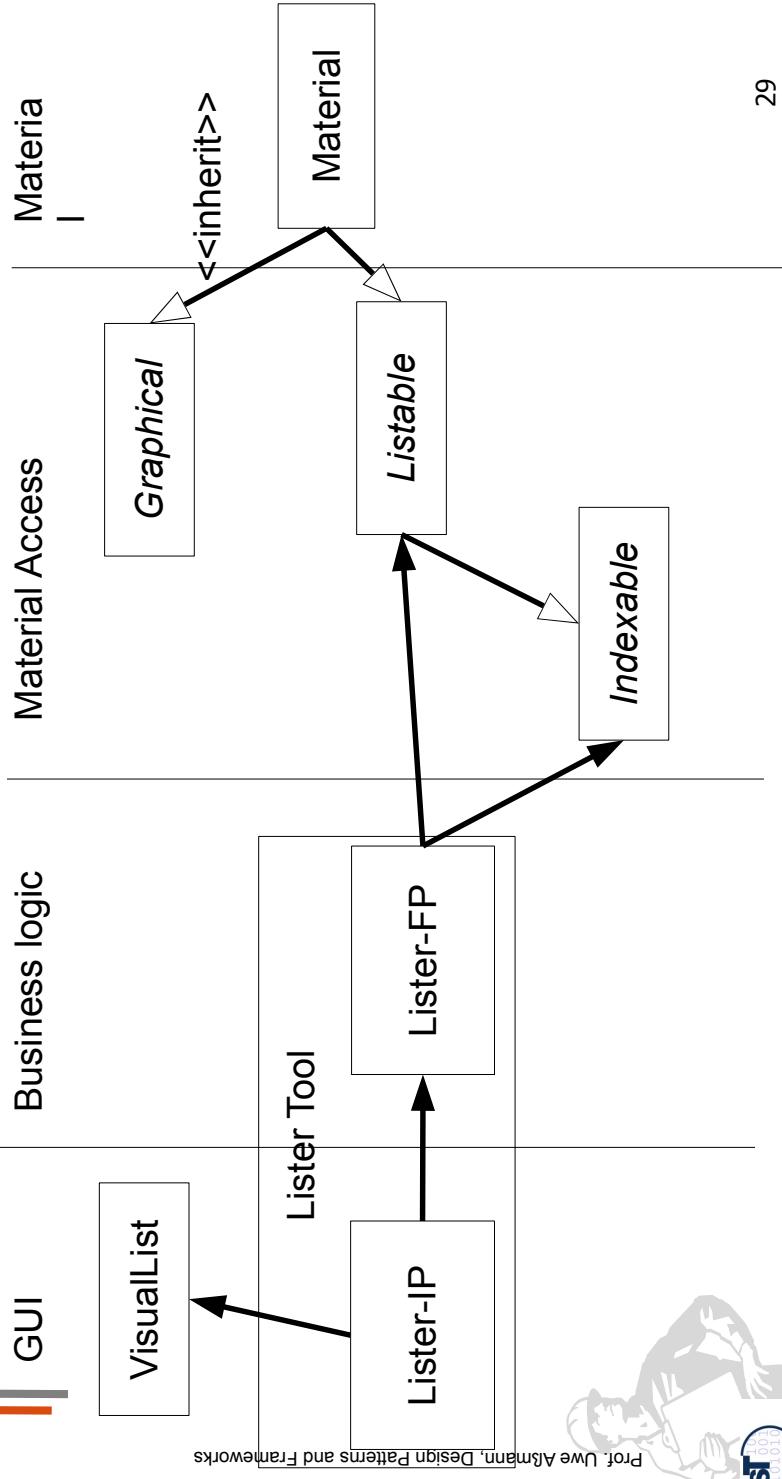

# Tool Construction: Separation of Function and Interaction

- Separation of function and interaction
  - Separation of user interface and application logic, as in 3-tier
  - Tools have one functional part and one or several interaction part
- Functional Part:
  - Manipulation of the material
  - Access to Material via material-roles
- Interaction Part:
  - Reactive on user inputs
  - Modelless, if possible
  - Can be replaced without affecting the functional part

# Interaction Part (IP) and Functional Part (FP)

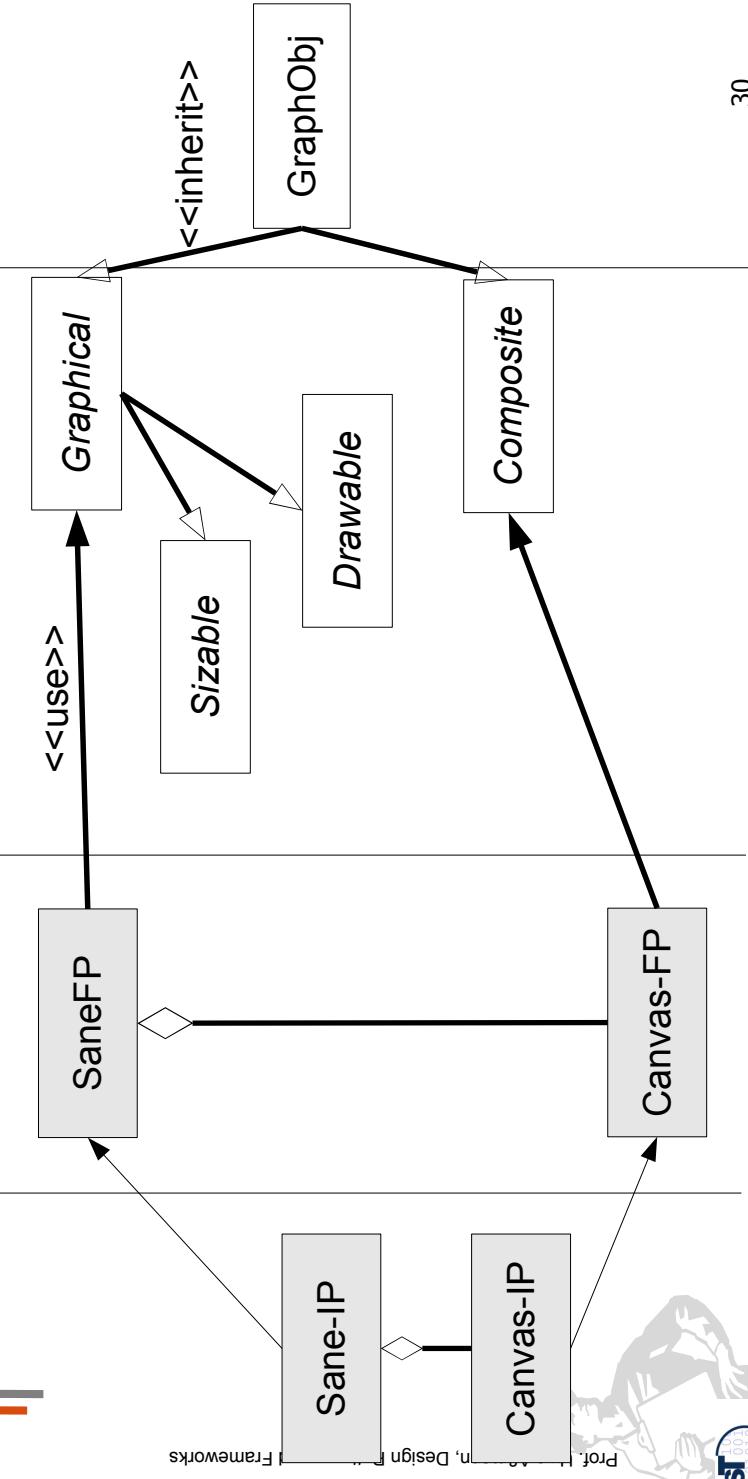

- FP create a new layer

29

## How TORA Tools Access Their Material

- Tool Sane is split into IP and FP
  - Manages a frame on the screen for drawing

30

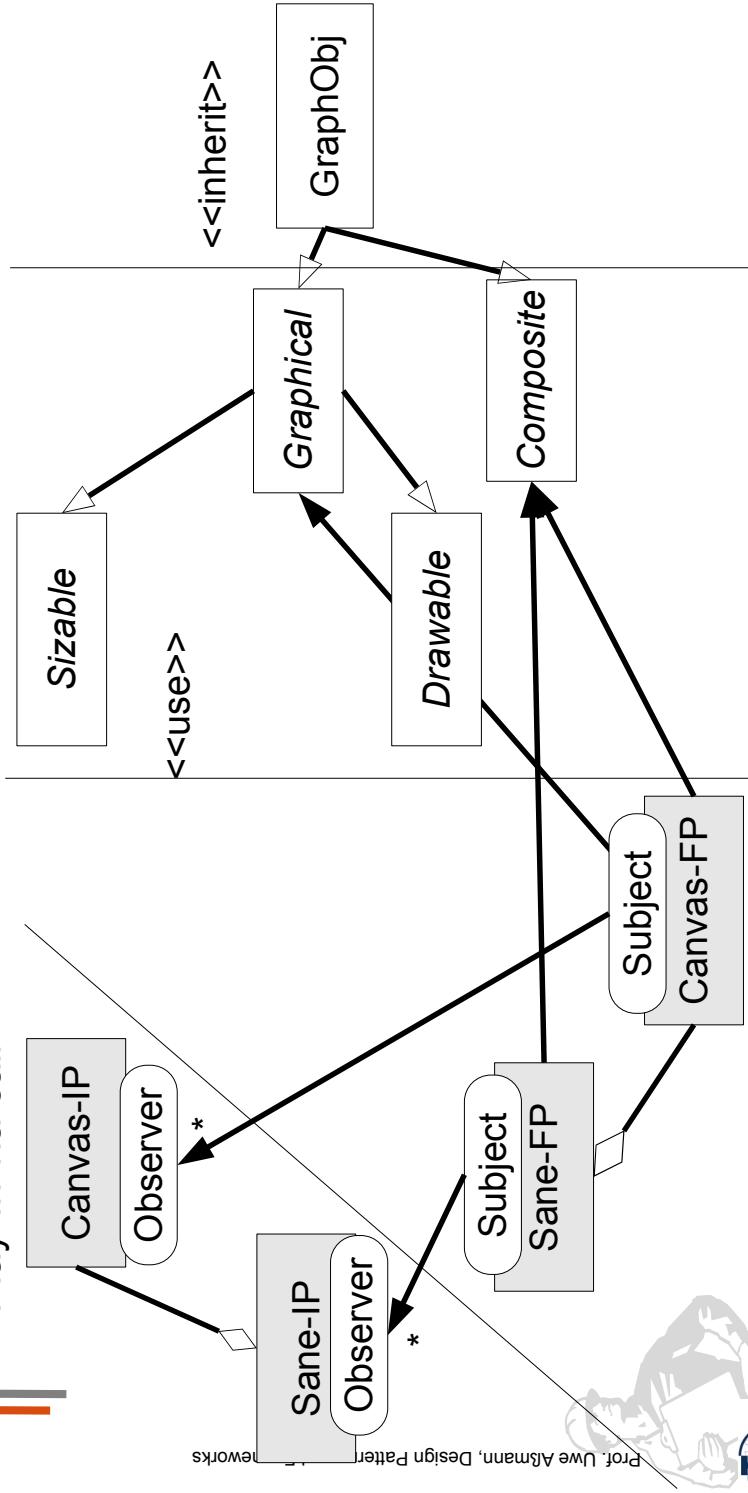

# IP-FP TAM Refines MVC

- ▶ Tools contain
  - a view (IP)
  - the controller (FP)
  - and the managing part of the model
- ▶ The model is split between tool-FP, material access, and material

31

## Coupling between Function and Interaction With Observer

- ▶ Play-Out via Observer pattern: IP listen to FP changes and actions
- ▶ Play-In via call

32

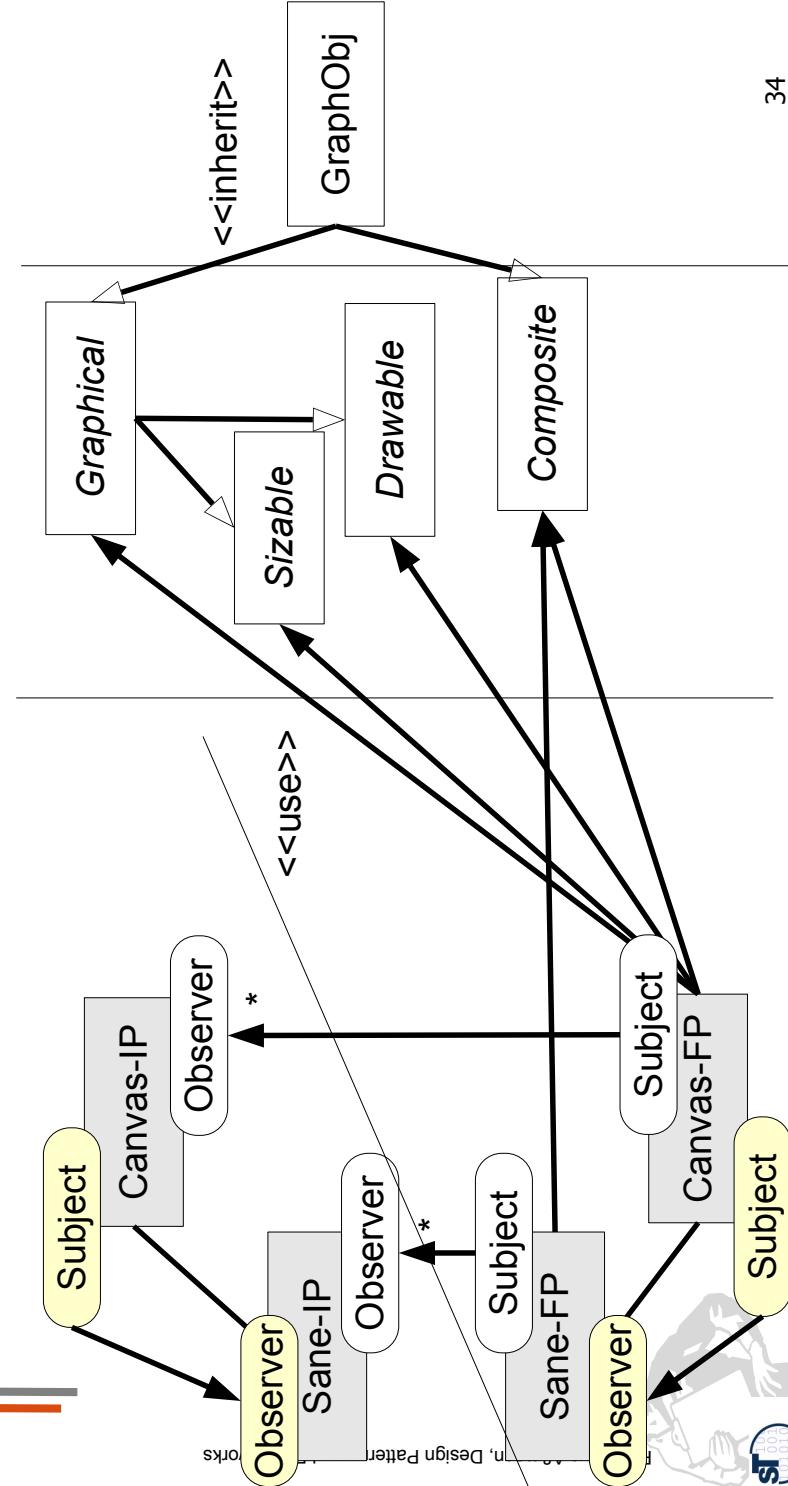

# Coupling between Subtool-FP and Supertool-FP

- ▶ Vertical tool decomposition by structuring into subtools with Bridge or Composite
- ▶ **Horizontal tool decomposition** into IP and FP
  - ▶ How to add new subtools at runtime?
    - Decomposition should be extensible
      - Vertically: for Composite, this is the case
      - Horizontally, Observer serves for extensibility
    - Communication should be extensible (next slide)

33

## Symmetric Coupling between Subtools and Supertools by Observer

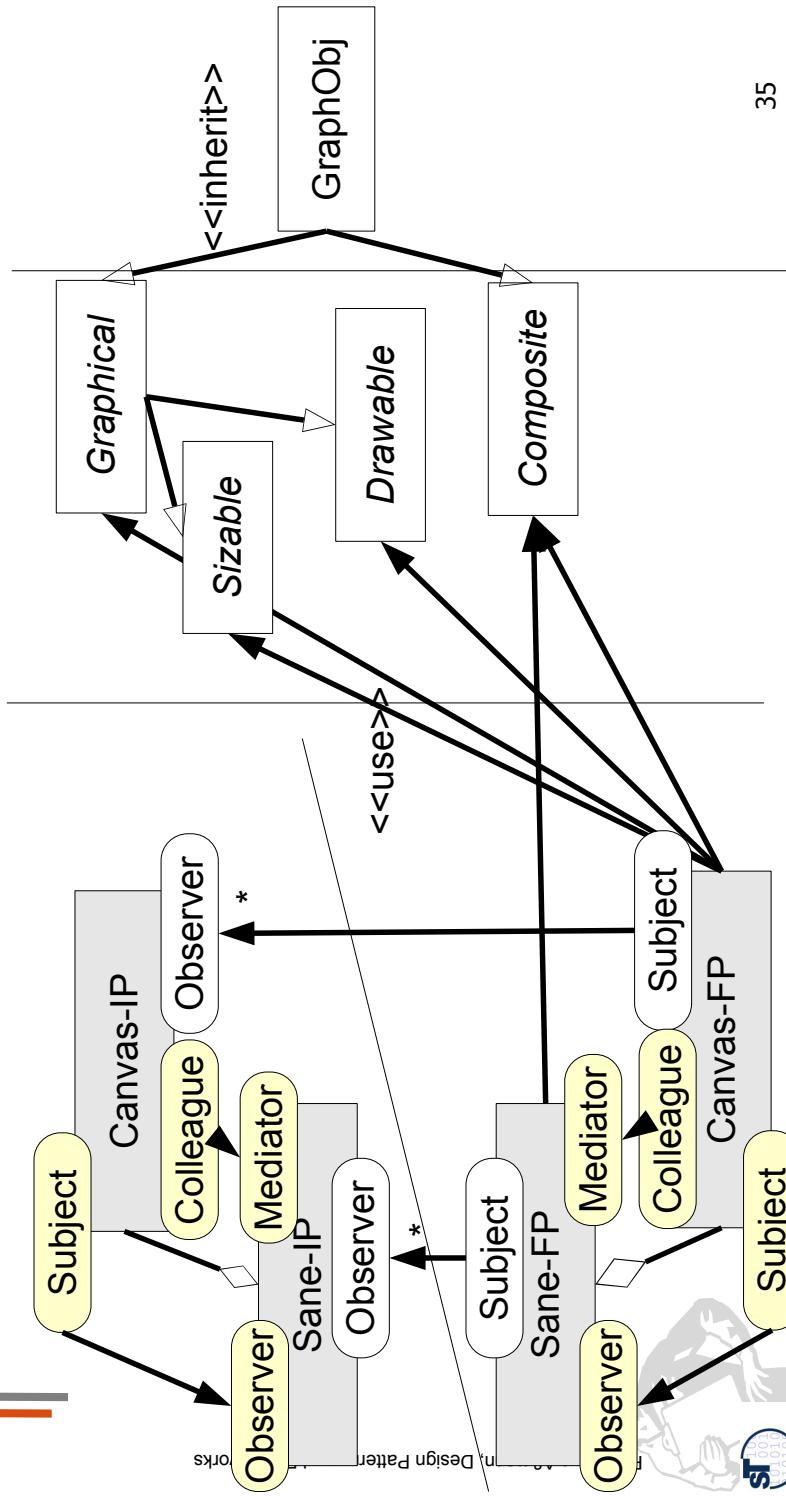

- ▶ Observer: Supertools are notified from subtools if something changes

34

# Coupling between Subtools and Supertools By Symmetric Bureaucracy

- IP and FP hierarchy can work with a Bureaucracy each

35

# Creation of New Subtools

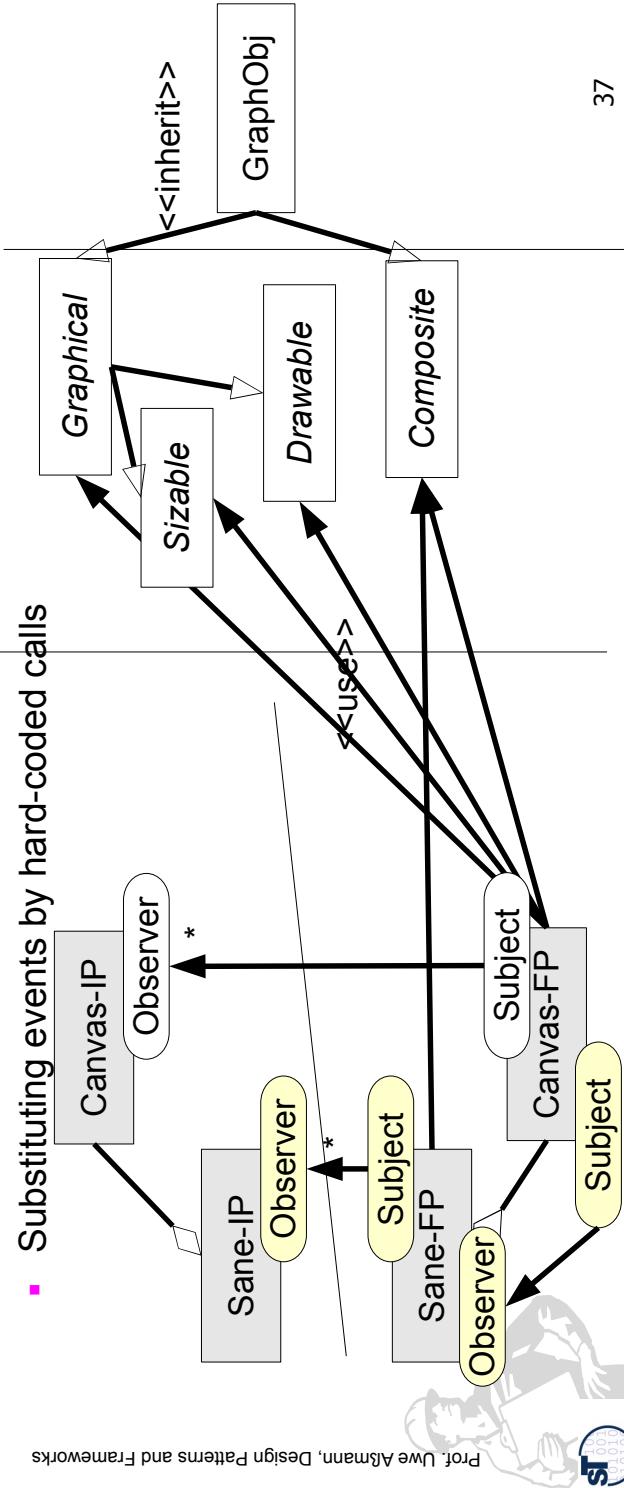

- Initiated by a Super-FP, which decides to create a new sub-FP

## Steps:

- Super-FP notifies Super-IP
- Super-IP may create one or several sub-IP
  - Connects them as observers to the sub-FP

# Non-Symmetric Coupling between Subtools and Supertools

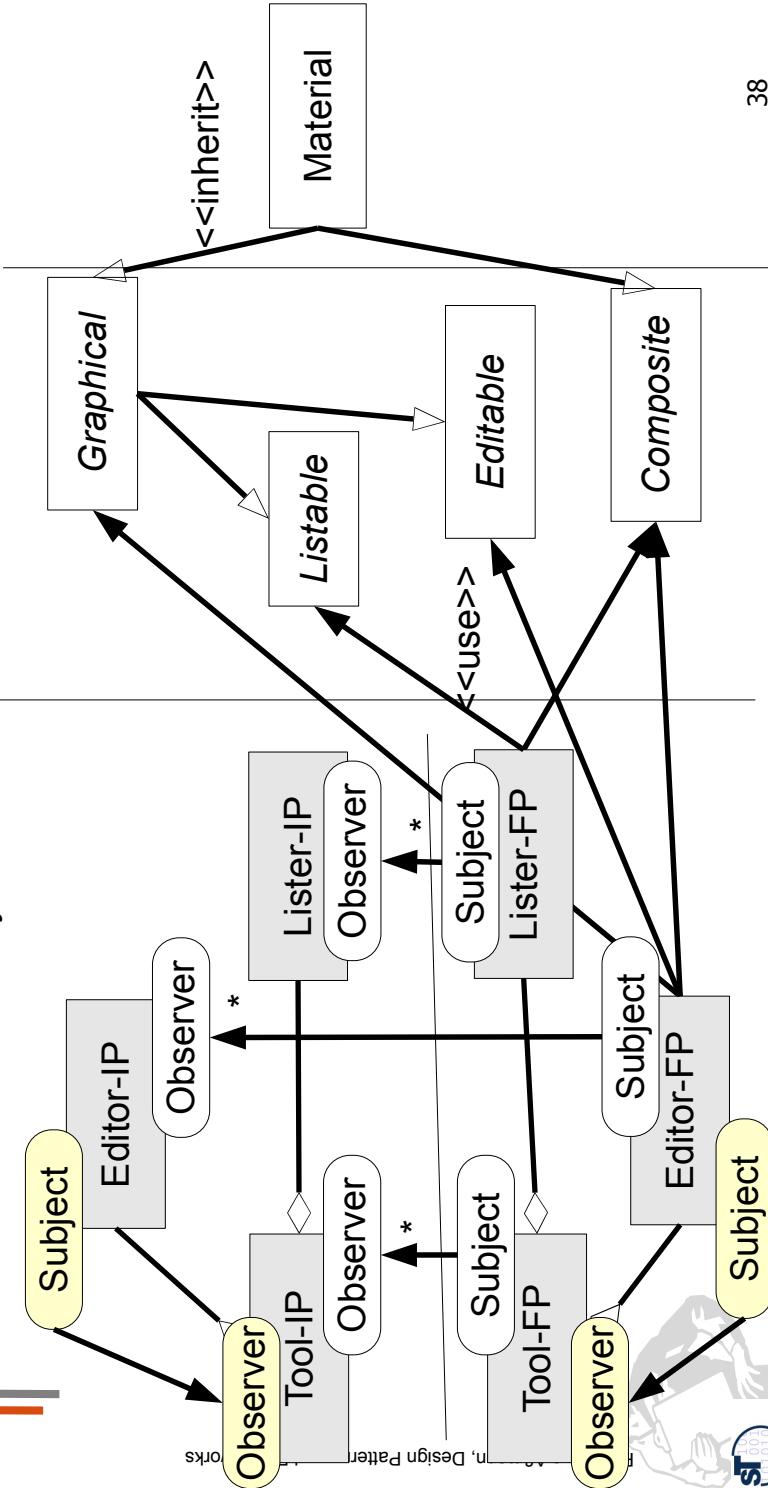

- ▶ Super-IPs can be notified by Super-FPs
- ▶ Optimization: Several of the event channels can be coalesced for better runtime behavior
  - Merging FP and IP again, getting rid of Observer, but no extensibility anymore
  - Substituting events by hard-coded calls

37

## Example: Generic Editor and Lister Framework

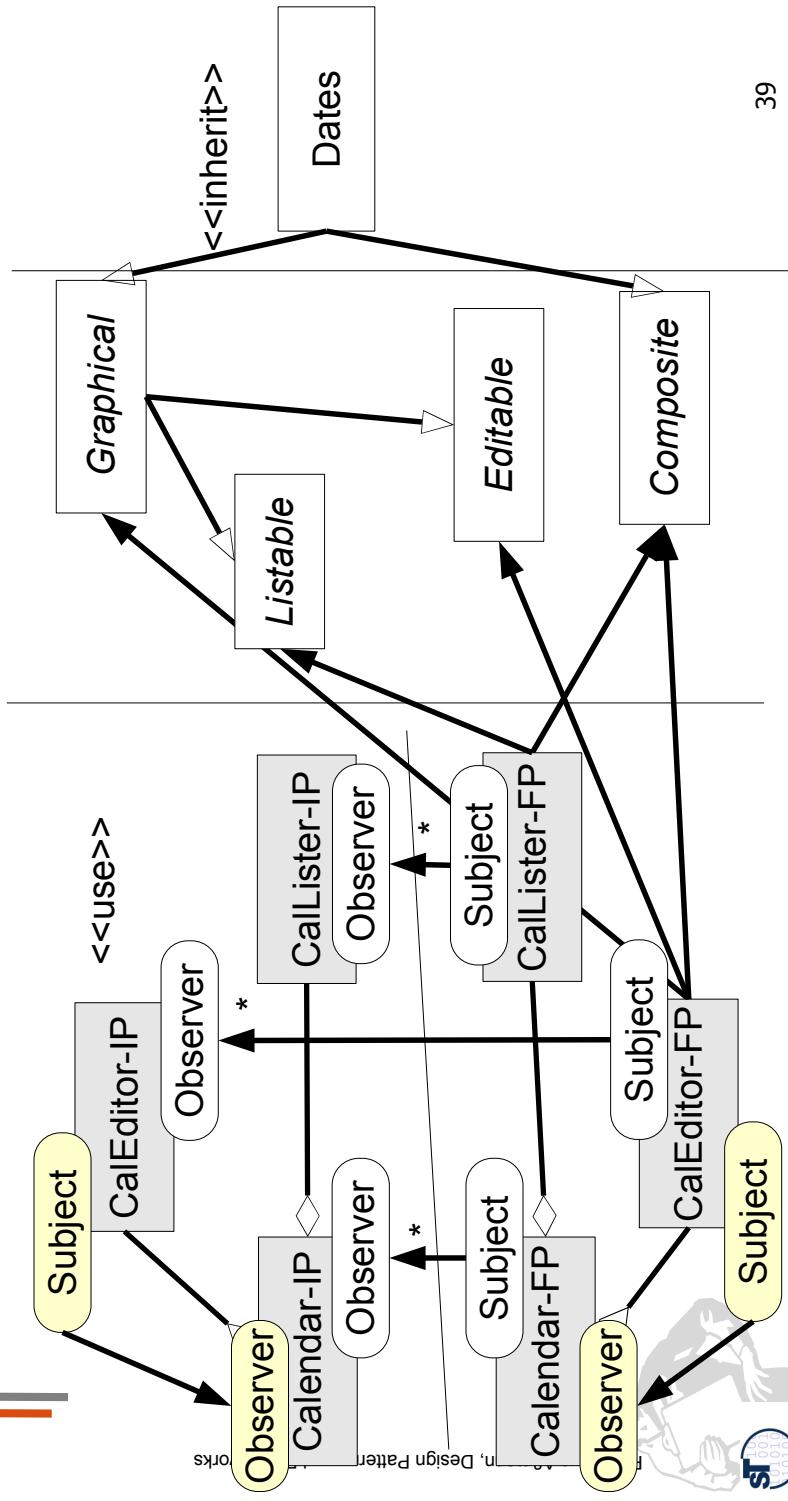

- ▶ Supertools are notified from subtools if something changes
- ▶ Can be used for every editor and lister of material

38

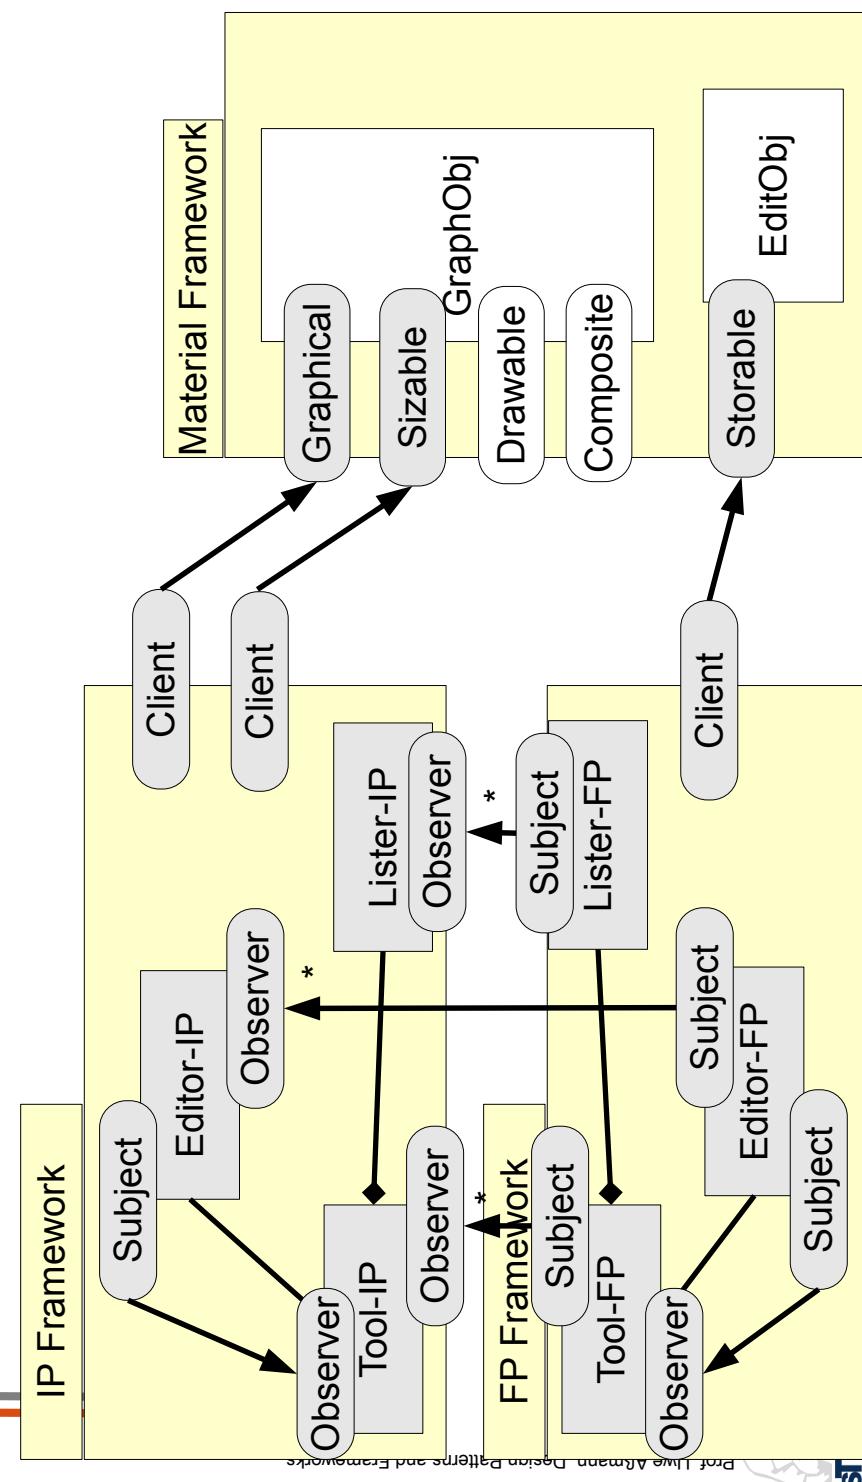

# Instantiated to a Calendar Editor and Lister Tool

- ▶ Supertools are notified from subtools if something changes

39

# The Generic Editor in Framework Notation

### 13.3 Environment

41

Design Patterns and Frameworks, © Prof. Uwe Alßmann

## The Environment

- ▶ Tools and Materials live in an environment with
  - Tool coordinators
  - Material administrations
  - Event coordinators
- ▶ The environment initializes everything, displays everything on the desktop, and waits for tool launch

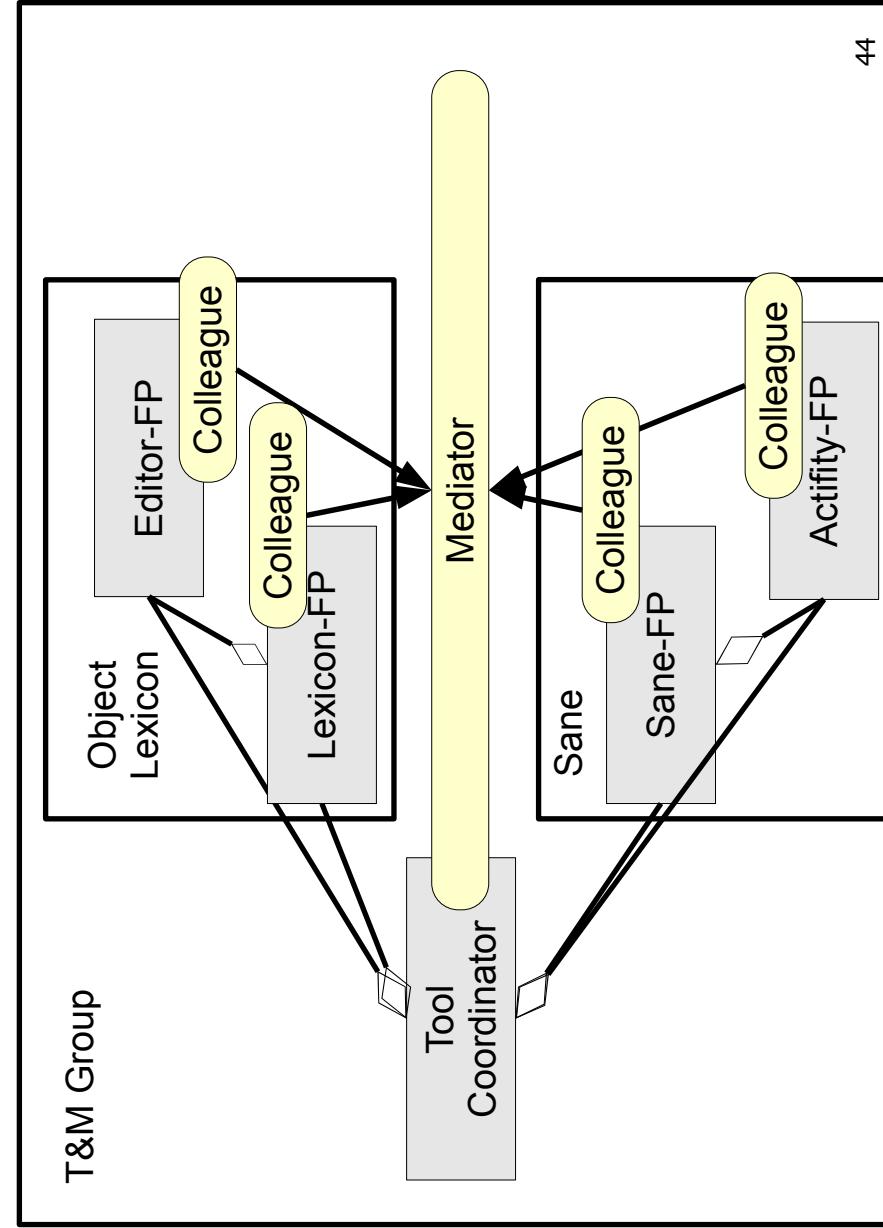

42

# Tool Coordinator

- ▶ The **tool coordinator** is a global object
  - Groups a set of tools and their related material
  - Contains
    - A Tool-Material dictionary of all tools and the materials they work on
    - A tool factory
  - ▶ Is a Mediator between FPs and other tools
    - Usually, FPs talk to their supertools and their related IPs. When materials depend on other materials in complex ways, other tools have to be informed
    - The ToolCoordinator uses the Tool-Material dictionary to notify tools appropriately

43

## Example: TORA Tool Coordinator

44

## 13.3.1. Pattern: Constrained Material Container

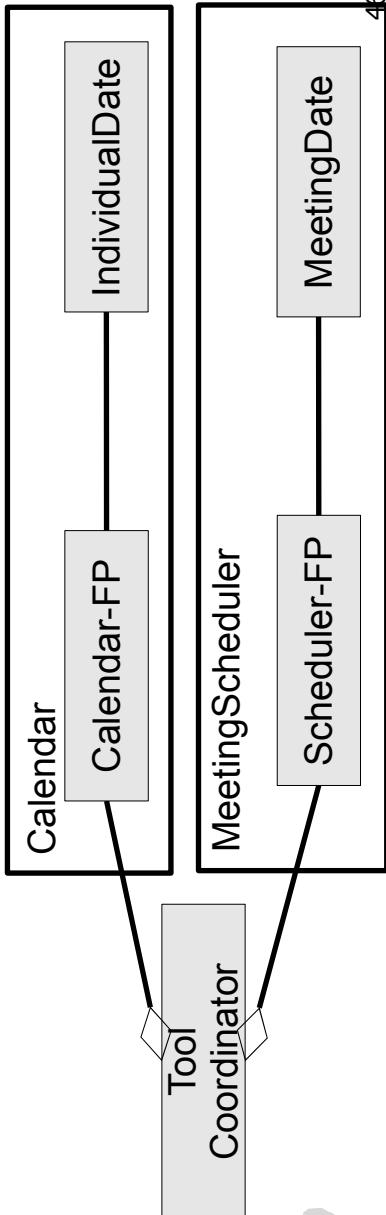

45

Design Patterns and Frameworks, © Prof. Uwe Alßmann

## Problem: Dependencies Among Materials

- Materials may depend on each other
  - Example MeetingScheduler
    - Maintains regular meeting dates (week, month, year)
    - Should collaborate with the Calendar tool that maintains individual dates
  - Clearly, these materials are dependent on each other
    - The Calendar tool should take in meetings as individual dates
    - The MeetingScheduler should block meetings if individual dates appear in the calendar

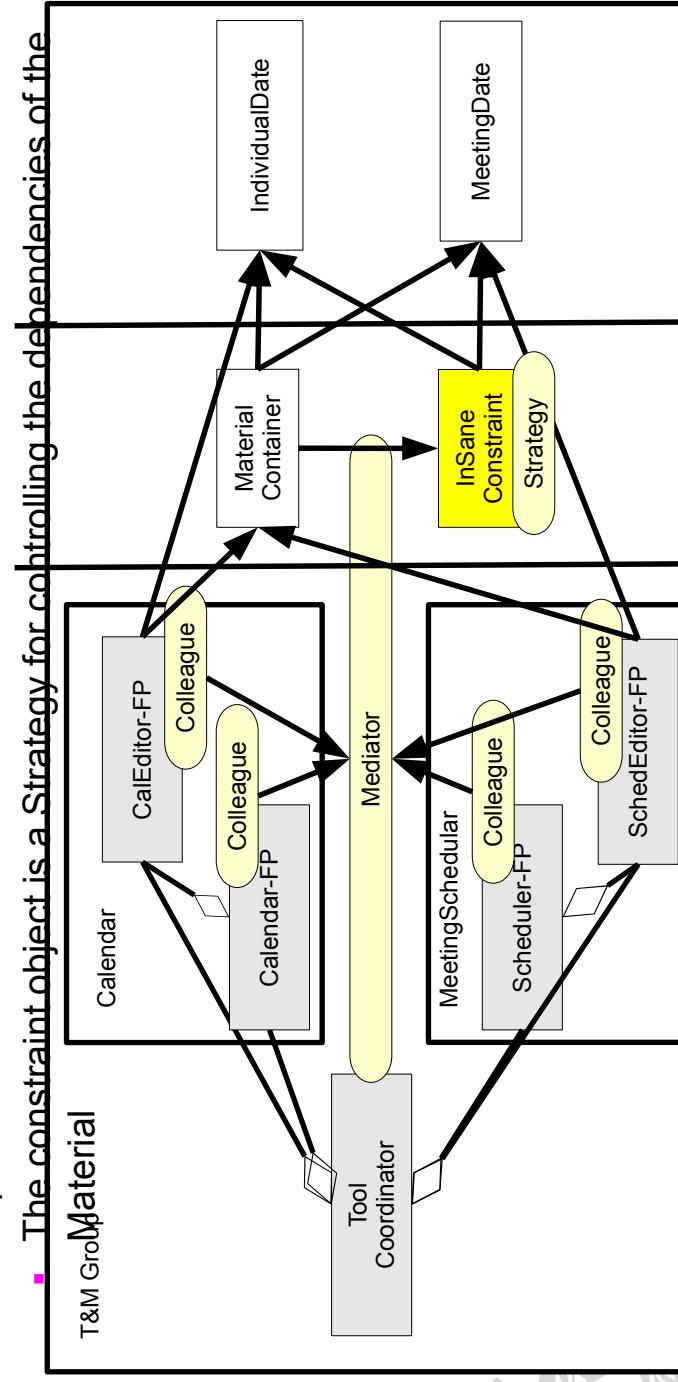

46

# Pattern: Constrained Material Container

- ▶ We group all material that depend on each other into one *Material container*
  - And associate a *constraint object* `InSaneConstraint` that maintains the dependencies

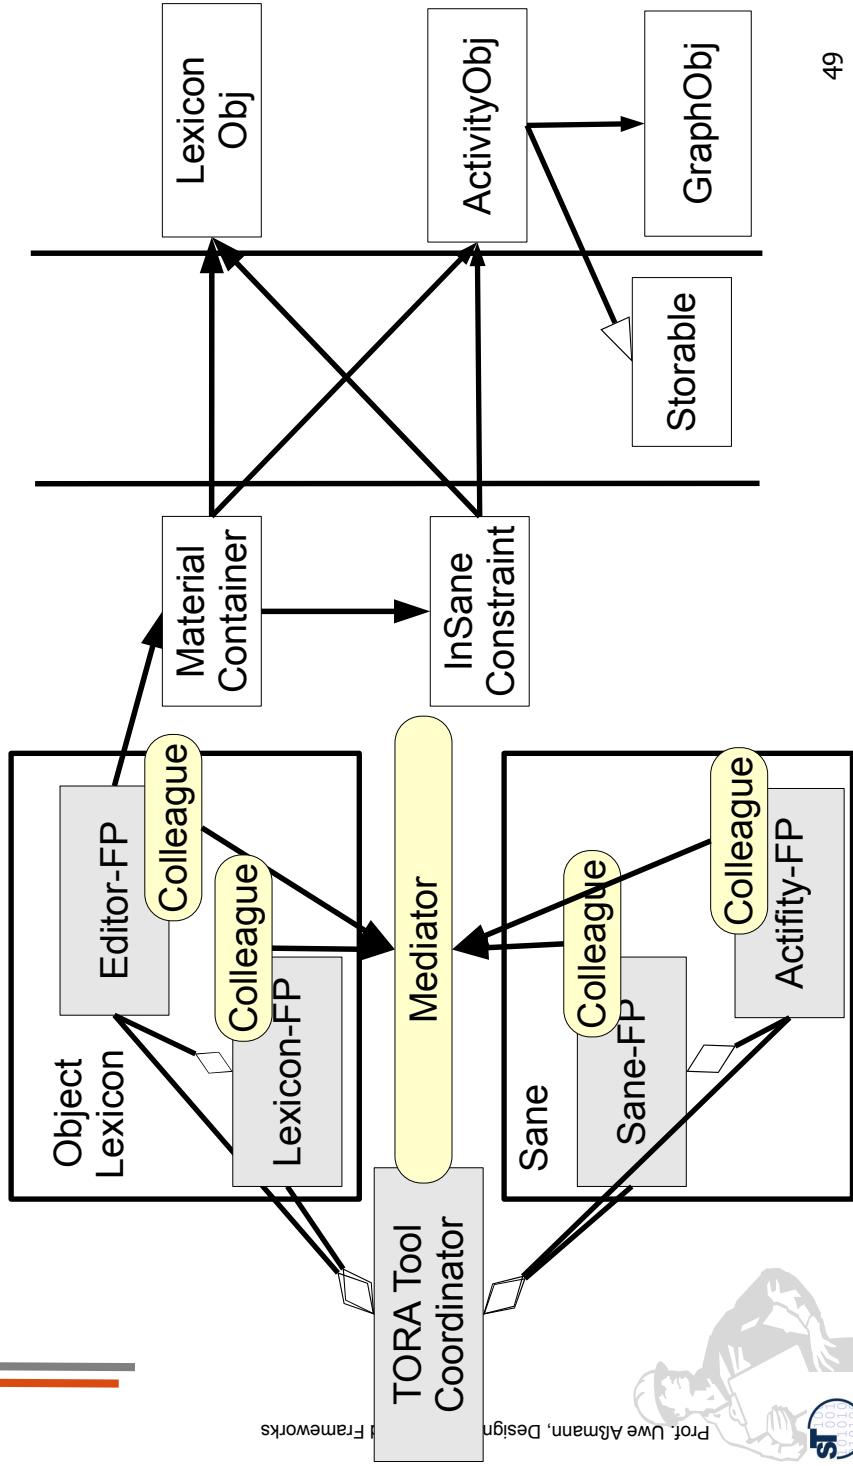

# Tool Coordinator and Material Container

- ▶ Unfortunately, Constrained Material Containers of the group must query the dictionary of the Tool Coordinator,
  - to know about the currently available tools, to activate constraints
    - (which introduces an ugly dependency between them...)

## Example:

## How TORA Tools Access Their Material

## TORA Material Constraints

- For each ActivityObj, there is a LexiconObj
  - The user can textually edit the LexiconObj to document the ActivityObj and the GraphObj
- All Materials are in a MaterialContainer
  - Uses a ConstraintObject InSaneConstraint to make sure that the label of the ActivityObj is always the same as that of the LexiconObj
  - If an ActivityObj is created, deleted, or changed, the tool coordinator is informed
    - And informs all related tools of TORA
    - The tool coordinator is a mediator

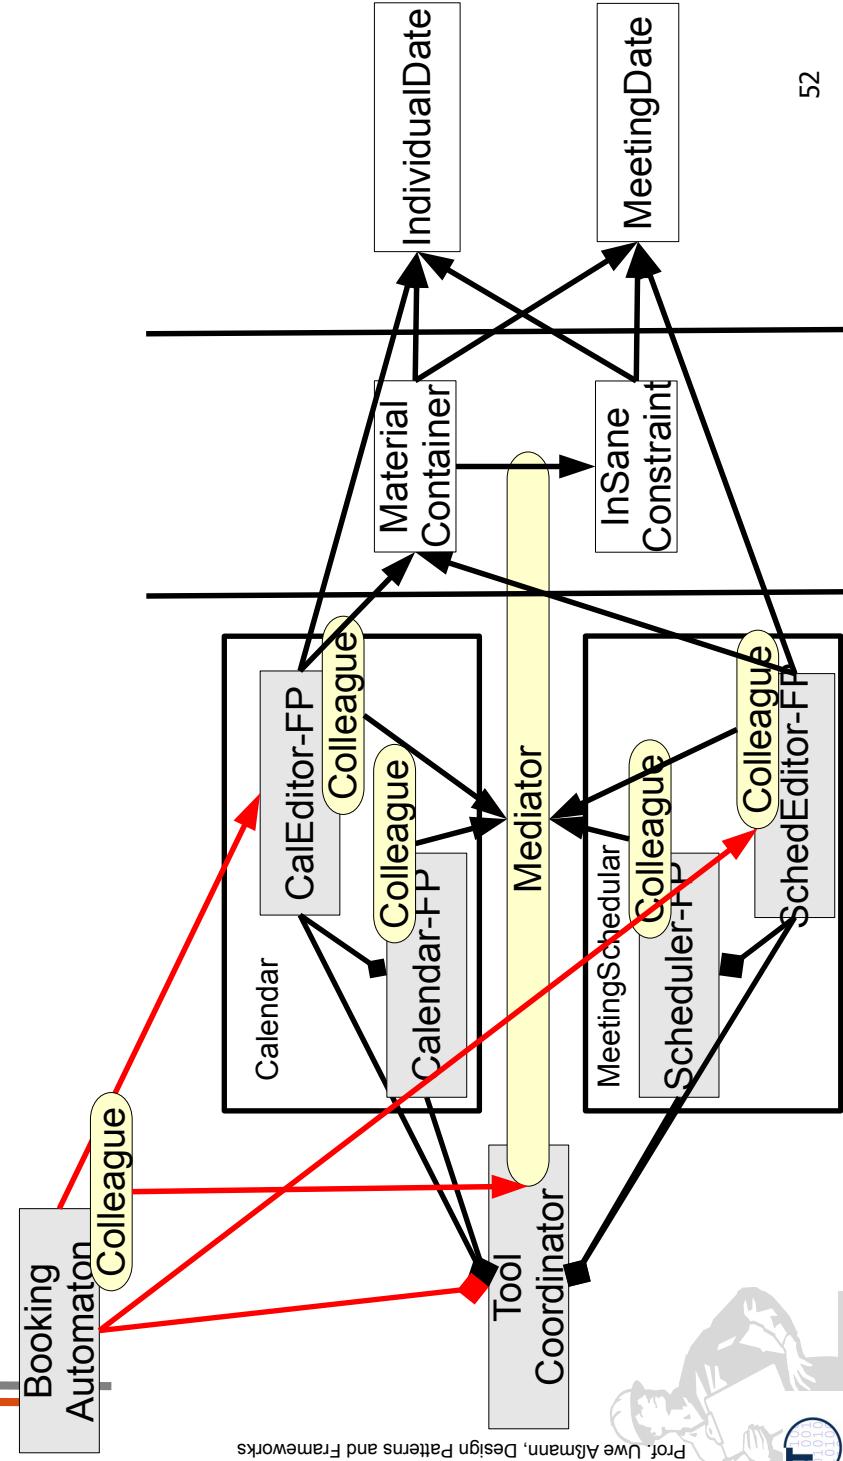

# Automaton

- ▶ An **automaton** is a automated tool for repeated tasks
  - Similar to a macro-tool
  - Is a variant of Macro-Command
  - Can run in the background
  - Often realized as separate machine processes
- ▶ An automaton encapsulates an automated **workflow** (or **process**)
  - Production of a complex artifact
  - Storing a complex technical object
  - Producing data in different versions
- ▶ Described by statecharts, activity diagrams, or Macro-Command objects

51

## An Automaton Booking Calendar Dates

- ▶ The Automaton books regular meetings as dates into the calendar

52

## 13.4 TAM and Layered Frameworks

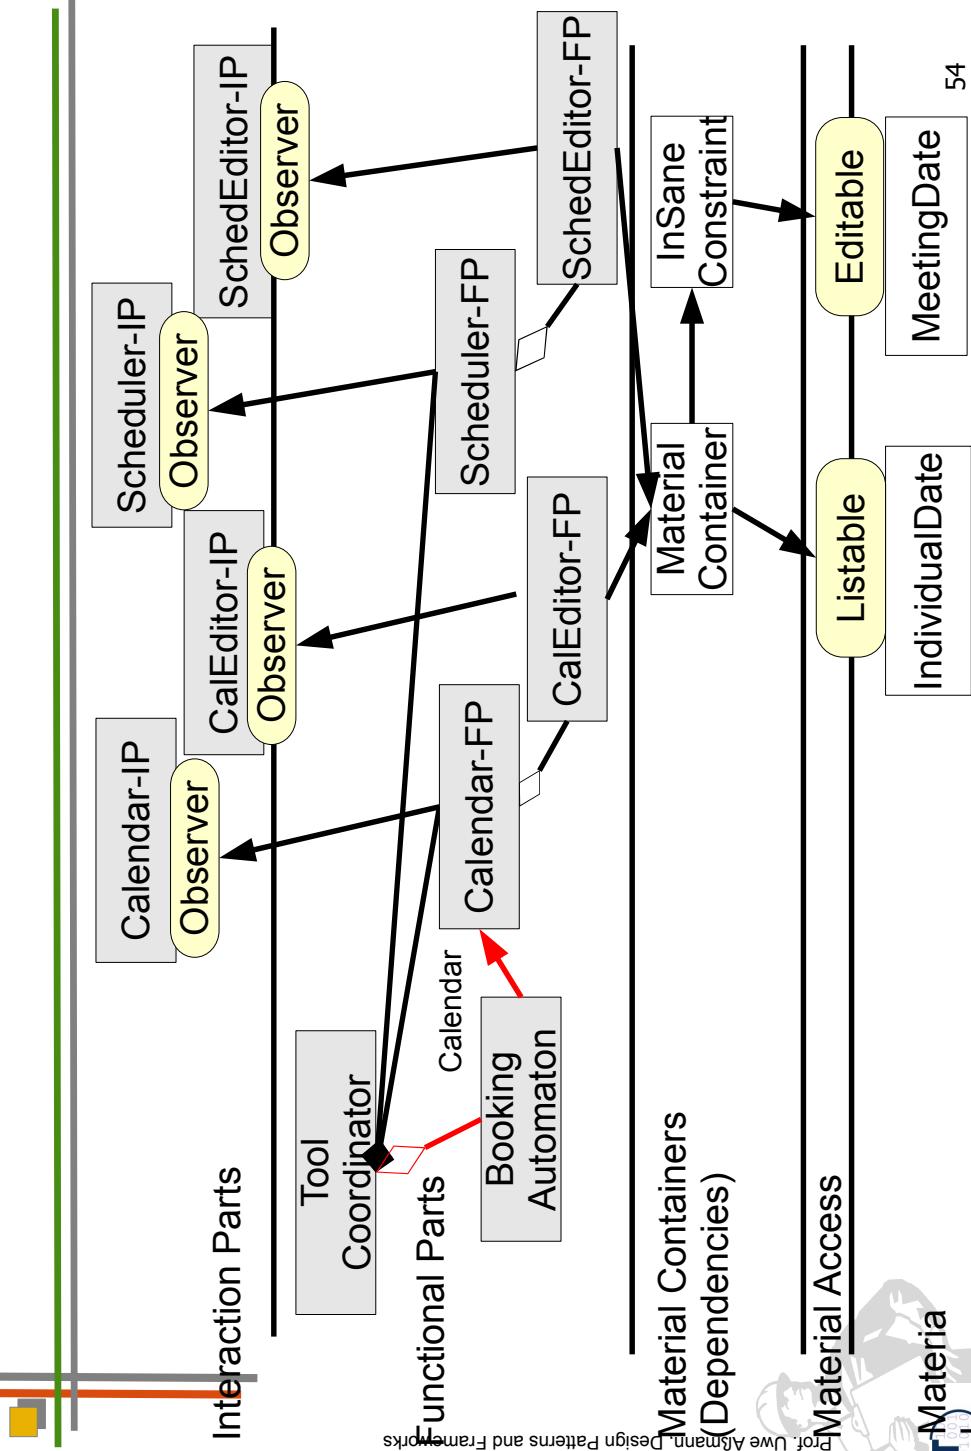

Now, let's order the patterns of TAM into layers  
What happens?

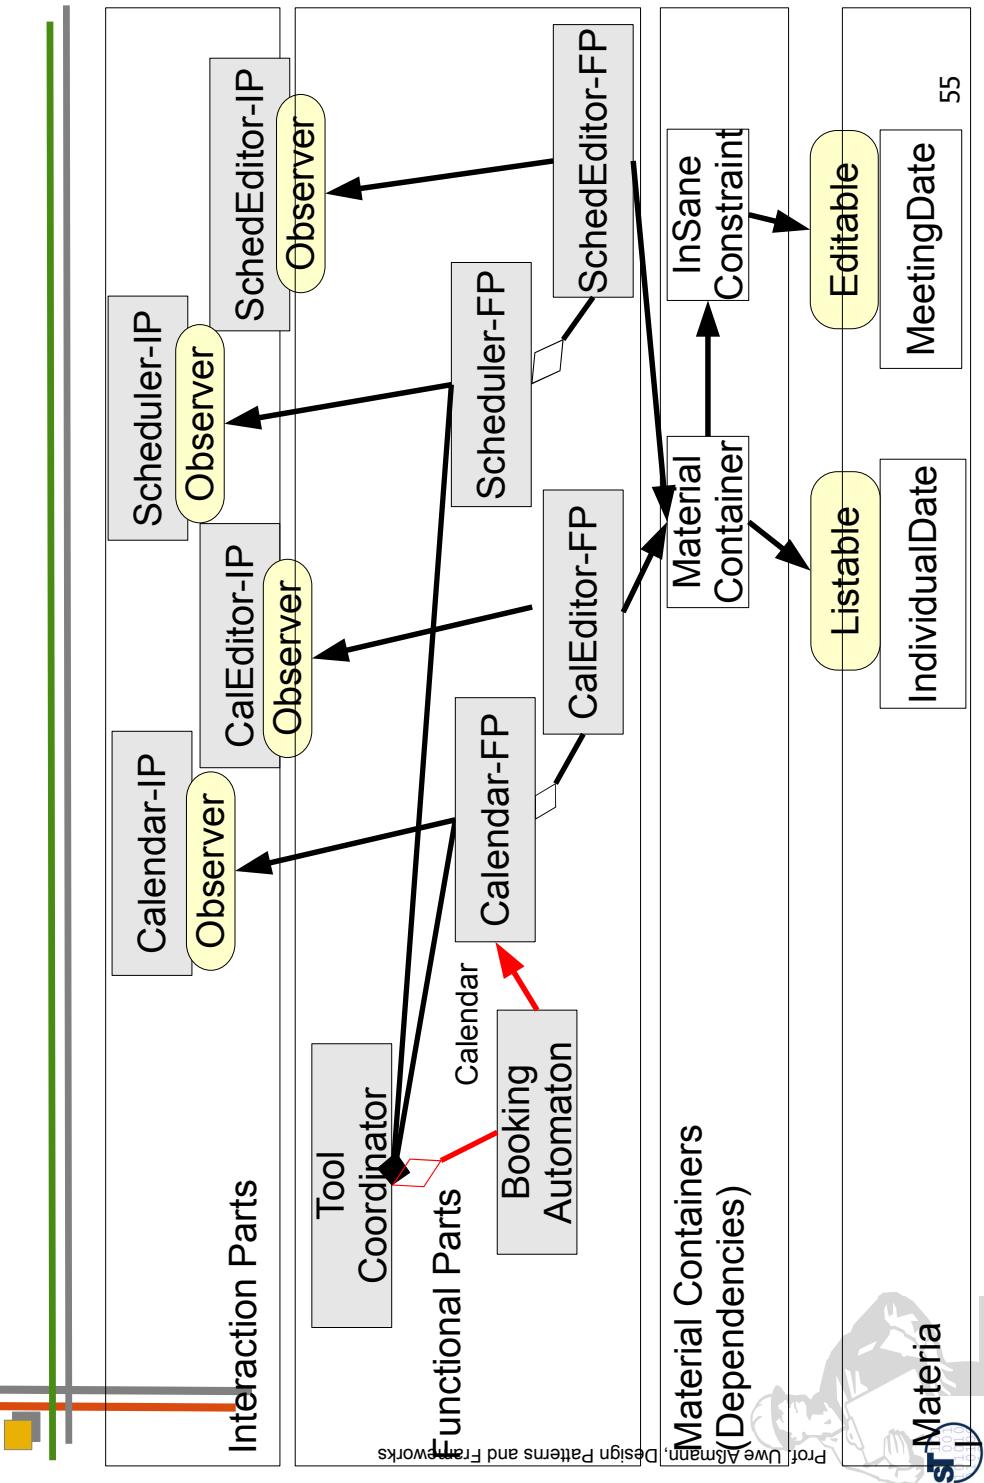

53

Design Patterns and Frameworks, © Prof. Uwe Aßmann

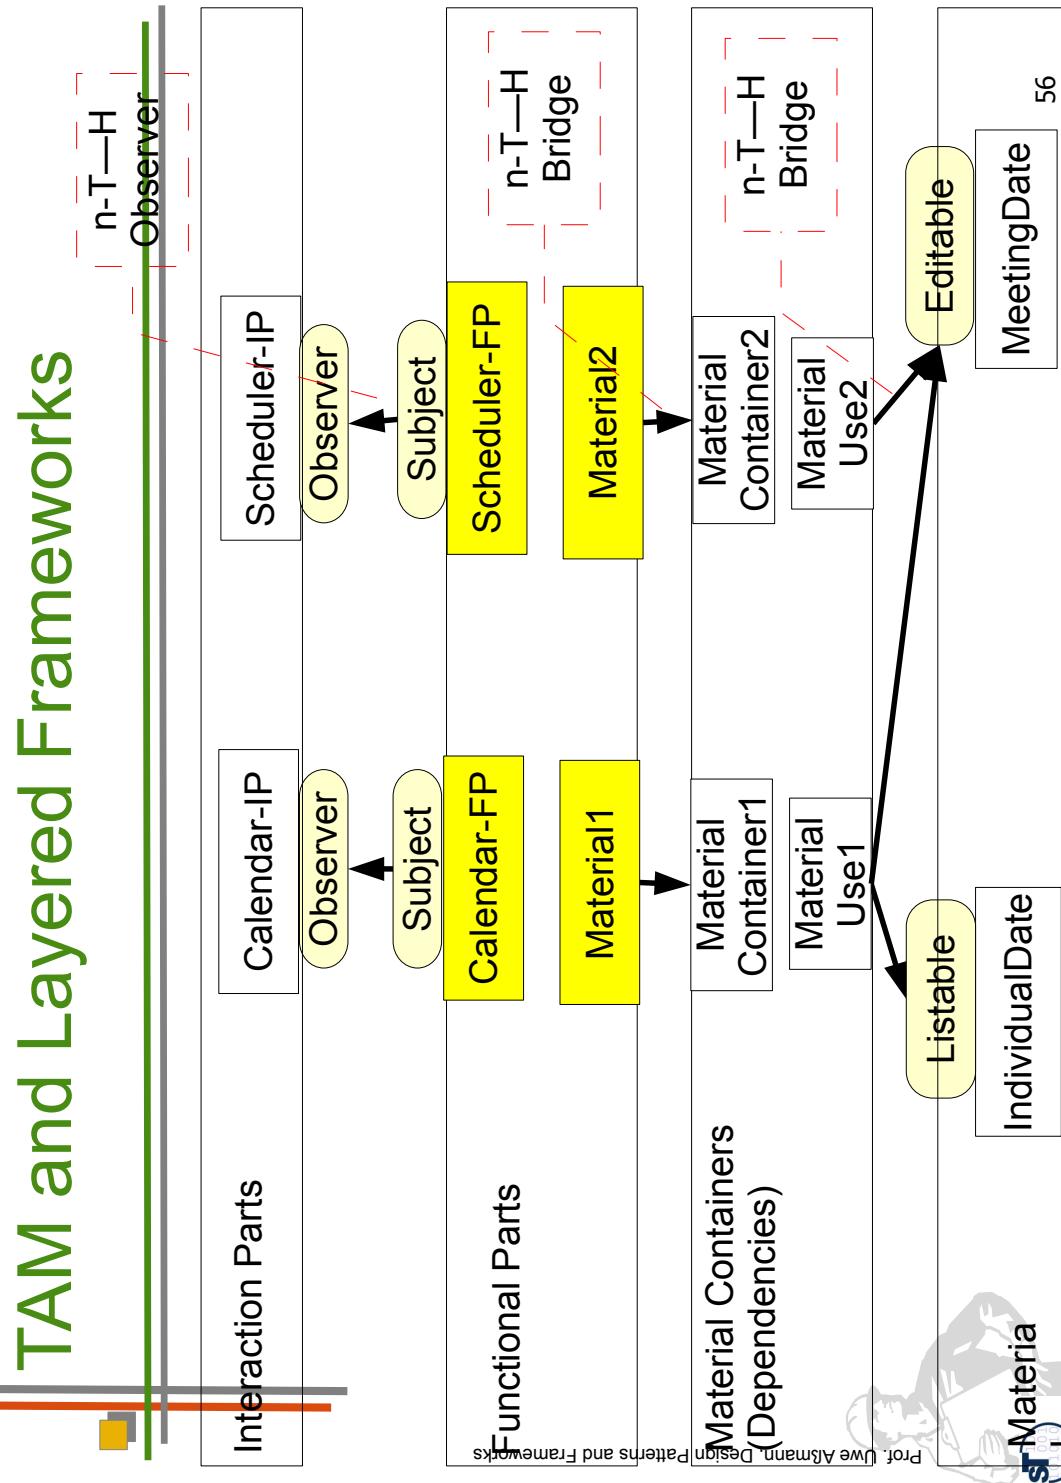

## TAM and Layered Frameworks

# TAM and Layered Frameworks

# TAM and Layered Frameworks

# TAM Is a Variant of a Layered Framework

- ▶ Combining different miniconnectors between the layers
  - n-T—H Observer between IP and FP
  - n-T—H Bridge between FP and MaterialUse
  - n-T—H Bridge between MaterialUse and Material, with roles as access for material
- ▶ Hence, interactive applications can be seen as instances of a layered framework
  - That uses not only RoleObject as mini-connectors, but also Observer and Bridge.
  - Hence the analogy to 3-tier
- ▶ This gives hope that we can construct layered frameworks for interactive applications in the future!

57

## Summary

- ▶ T&M is a pattern language for constructing interactive applications
  - Refines 3-tier and MVC
  - Uses Command, Strategy, Observer, Composite, etc.
  - Defines several new complex patterns such as Separation of IP and FP
- ▶ TAM is a variant of a layered framework, using n-T—H miniconnectors (Observer, Bridge) between the layers
  - Preel's framework hook patterns play an important role

58

The End
