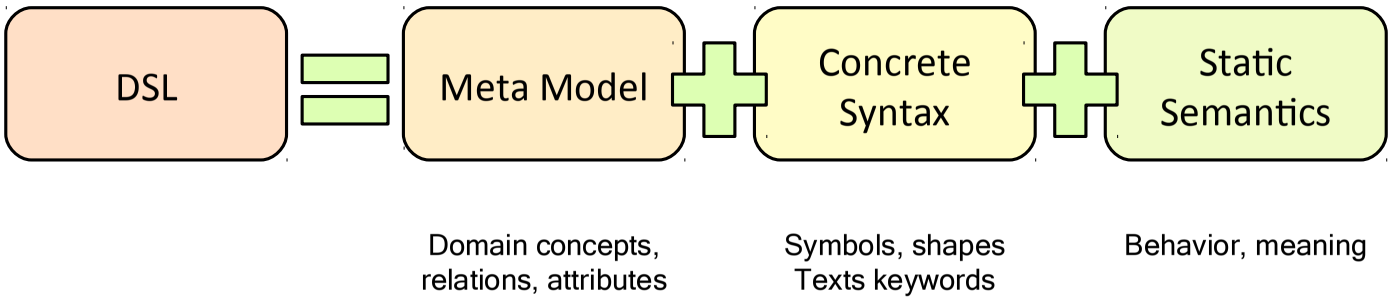
What's in a Domain-Specific Language (DSL)?



Productivity Gains with DSL

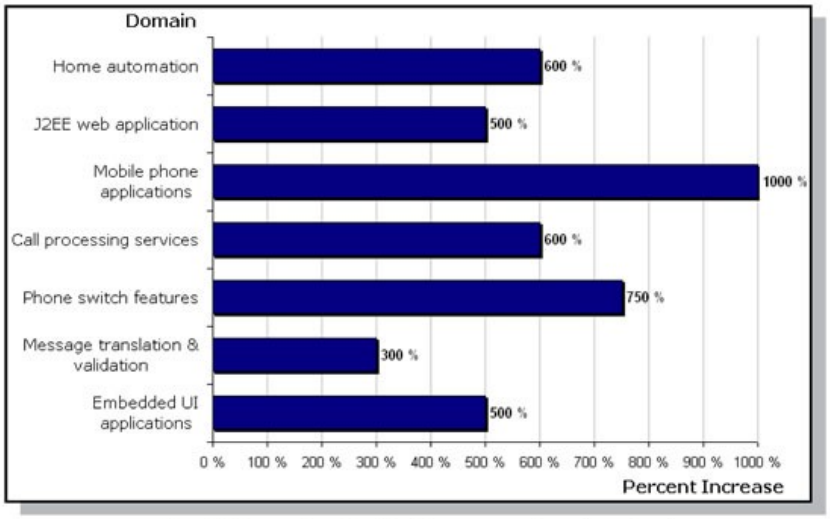


Figure 3: Measured productivity improvements in various domains

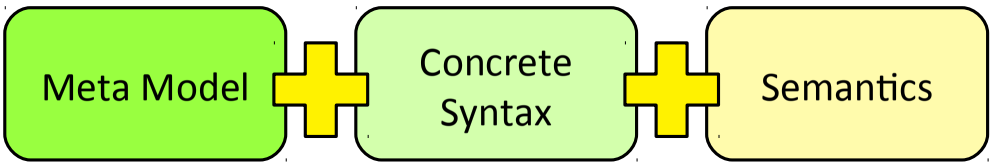
Juha-Pekka Tolvanen. Domain-Specific Modeling for Full Code Generation. January 2010. Vol. 12, Number 4. http://journal.thedacs.com/issue/52/144

What is a Textual Domain-Specific Language (DSL)?

- EMFText relates a concrete syntax specification (grammar in EBNF) to a EMOF/Ecore-based metamodel.
- From this language mapping, printers, parsers and editors for a DSL can be generated



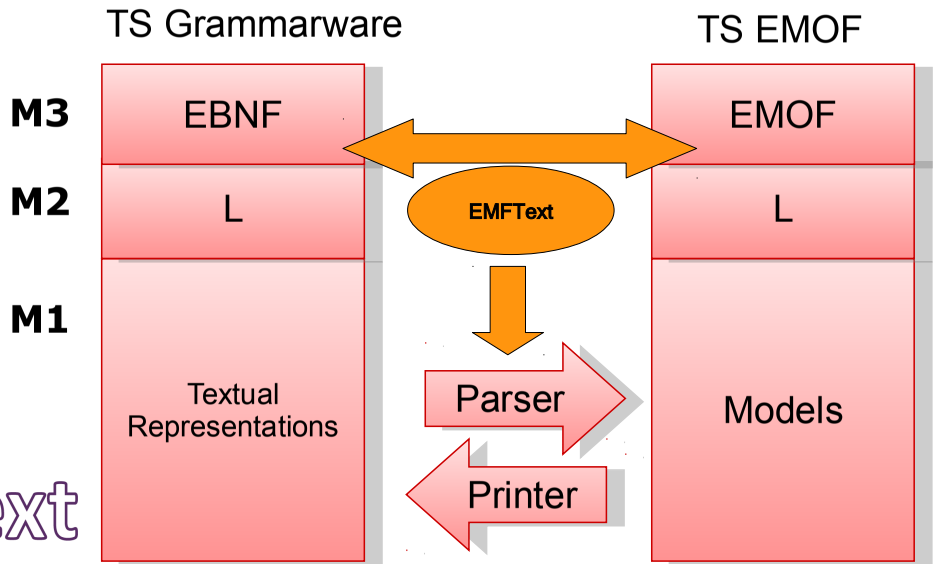
Domain concepts, relations, attributes

Textual concrete syntax

Static semantics

Textual DSL rely on a Transformation Bridge from EMOF to Grammarware

- EMFText relates a concrete syntax specification (grammar in EBNF) to a EMOF/Ecore-based metamodel.
- From this language mapping, printers (unparsers), parsers and editors are generated
- EMFText can be used to produce normative concrete syntax for exchange formats



emftext

Motivation – Why DSLs?

+ Use the concepts and idioms of a domain
+ Domain experts can understand, validate and modify DSL programs
+ Concise and self-documenting
+ Higher level of abstraction
+ Can enhance productivity, reliability, maintainability and portability
+ Embody domain knowledge, enabling the conservation and reuse of this knowledge

But:

- Costs of design, implementation and maintenance
- Costs of education for users
- Limited availability of DSLs

From: http://homepages.cwi.nl/~arie/papers/dslbib/

Motivation – Why textual syntax?

Why use textual syntax for models?

- Readability
- Diff/Merge/VCS
- Evolution
- Tool autonomy
- Quick model instantiation

Why create models from text?

- Tool reuse (e.g., to perform transformations (ATL) or analysis (OCL))
- Know-how reuse
- Explicit representation of text document structure
- Tracing software artifacts
- Graphs instead of strings

Be aware: exchange syntax is like a textual DSL

Philosophy and Goals

Design principles:

- Convention over Configuration
- Provide defaults wherever possible
- Allow customization for all parts of a syntax

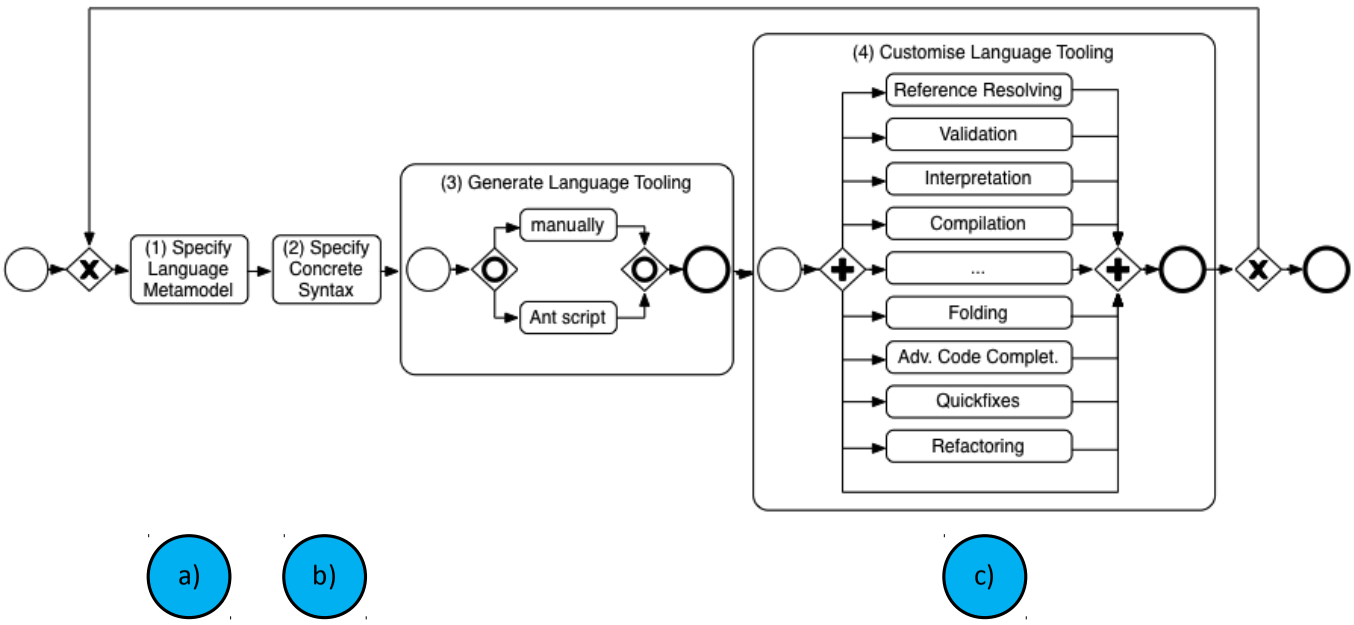
Syntax definition should be

- Simple and easy for small DSLs
- Yet powerful for complex languages

EMFText Features

- **Generation Features**
  - Generation of independent code
  - Generation of Default Syntax
  - Customizable Code Generation
- **Specification Features**
  - Modular Specification
  - Default Reference Resolving
  - Comprehensive Syntax Analysis
- **Editor Features**
  - Code Completion, Customizable Syntax and Occurence Highlighting, Code Folding, Error Marking, Hyperlinks, Text Hovers, Outline View, ...
- **Other Highlights**
  - ANT Support, Post Processors, Builder, Interpreter and Debugger Stubs, Quick Fixes

EMFText Language Development Process

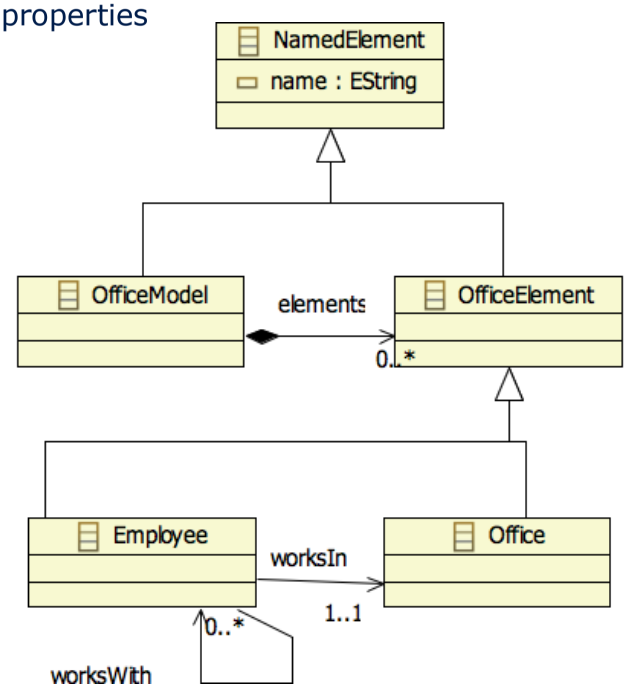


How to build a DSL – Meta model

a)

Creating a new meta model:

- Define concepts, relations and properties in an Ecore model



Existing meta models can be imported (e.g., UML, Ecore, …)

emftext

TECHNISCHE UNIVERSITÄT DRESDEN

How to build a DSL – Meta model

a)

Meta model elements:

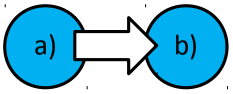
- Classes
- Data Types
- Enumerations

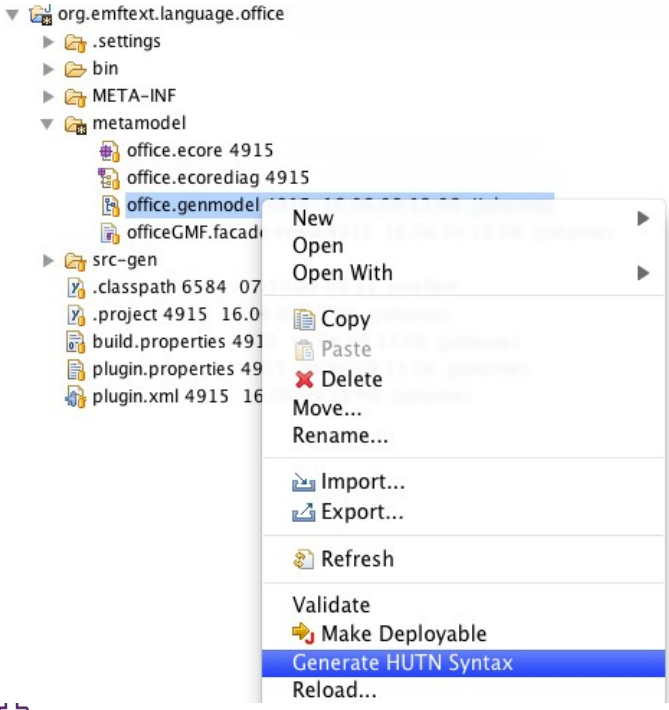
- Attributes
- References (Containment, Non-containment)
- Cardinalities

- Inheritance

emftext

Generate initial syntax (Human Usable Text Notation)





emftext

Initial HUTN syntax

office.cs

```
SYNTAXDEF office
FOR <http://emftext.org/office>
START OfficeModel

TOKENS{
    DEFINE COMMENT$'//'(~('\n'|'\r'|'\uffff'))*$;
    DEFINE INTEGER$('-')?('1'..'9')('0'..'9')*|'0'$;
    DEFINE FLOAT$('-')?(('1'..'9') ('0'..'9')* | '0') '.' ('0'..'9')+ $;
}

TOKENSTYLES{
    "OfficeModel" COLOR #7F0055, BOLD;
    "name" COLOR #7F0055, BOLD;
    "elements" COLOR #7F0055, BOLD;
    "Employee" COLOR #7F0055, BOLD;
    "worksIn" COLOR #7F0055, BOLD;
    "worksWith" COLOR #7F0055, BOLD;
    "Office" COLOR #7F0055, BOLD;
}

RULES{

    OfficeModel::= "OfficeModel"  "{" ( "name"  ":" name['"','"'] | "elements"  ":" elements  )* "}"  ;

    Employee::= "Employee"  "{" ( "name"  ":" name['"','"'] | "worksIn"  ":" worksIn[]| "worksWith"  ":" worksWith[] )* "}"  ;

    Office::= "Office"  "{" ( "name"  ":" name['"','"']  )* "}"  ;

}
```

emftext

Initial HUTN syntax – Example Document

b)

st.office

```
OfficeModel {
    name : "SoftwareTechnology"

    elements :
        Office {
            name : "INF2080"
        }

    elements :
        Office {
            name : "INF2084"
        }

    elements :
        Employee {
            name : "Florian"
            worksIn : INF2080
            worksWith : Jendrik
        }

    elements :
        Employee {
            name : "Jendrik"
            worksIn : INF2084
            worksWith : Florian
        }
}
```

emftext

Syntax refinement – The CS language

b)

Structure of a .cs file:

- Header
  - File extension
  - Meta model namespace URI, *location*
  - Start element(s)
  - *Imports (meta models, other syntax definitions)*
- *Options*
- *Token Definitions*
- Syntax Rules

office.cs

```
SYNTAXDEF office
FOR <http://emftext.org/office>
START OfficeModel

RULES{
    OfficeModel ::= "officemodel" ;
}
```

Outline

- office : http://emftext.org/office
  - TEXT
  - WHITESPACE
  - LINEBREAK
  - officemodel
  - OfficeModel
    - Choice

emftext

Syntax refinement – Syntax rules in EBNF

b)

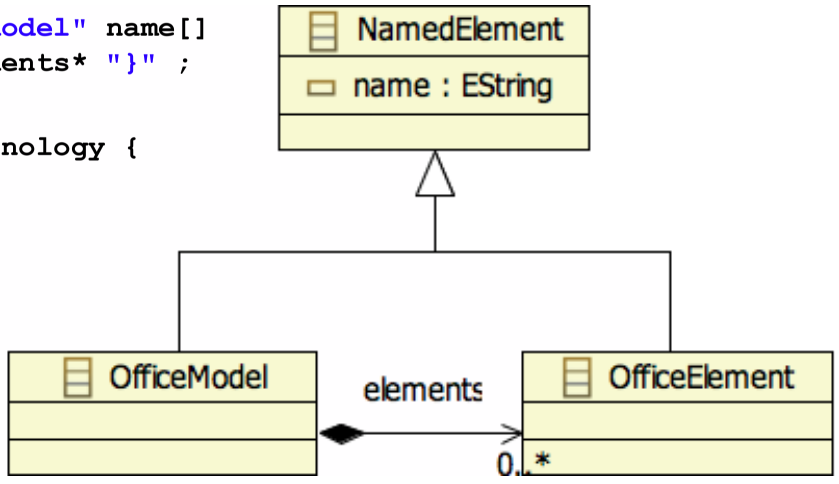
- One per meta class
  - Syntax: MetaClassName ::= *Syntax Definition* ;
- Definition elements:
  - Static strings (keywords) "public"
  - Choices a|b
  - Multiplicities +,*
  - Compounds (ab)
  - Terminals a[] (Non-containment references, attributes)
  - Non-terminals a (Containment references)

Customized Syntax Rules - Examples

b)

```
OfficeModel ::= "officemodel" name[]
                "{" elements* "}" ;

officemodel SoftwareTechnology {
  ...
}
```



Customized Syntax Rules - Examples

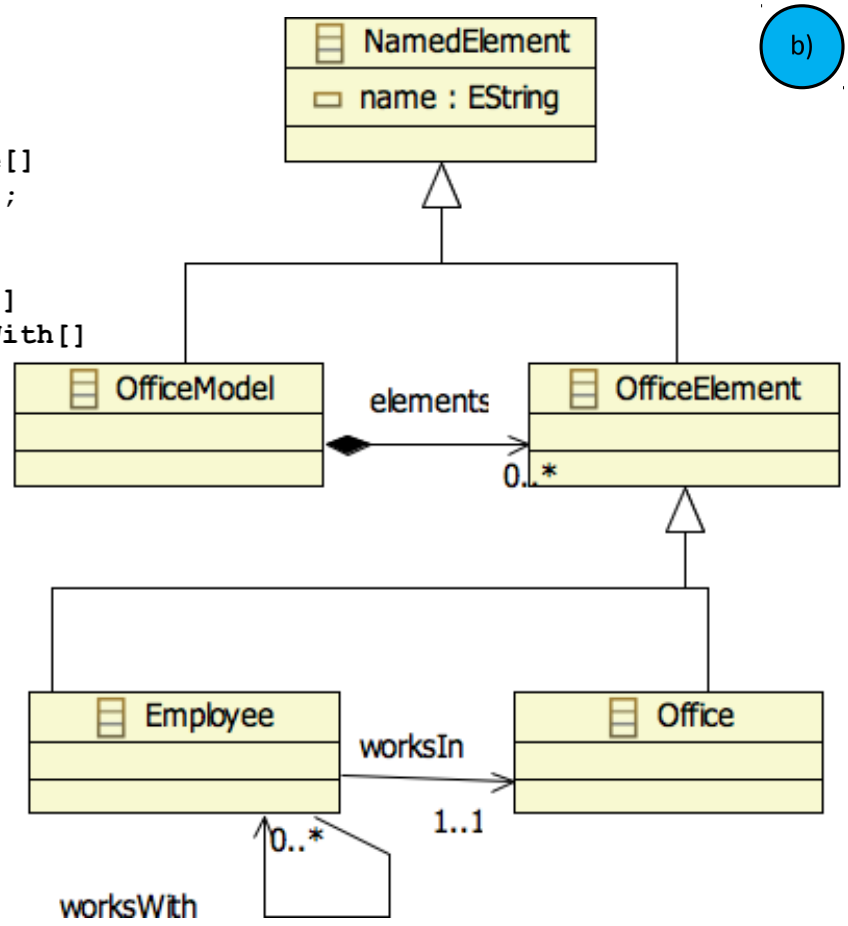
```
OfficeModel ::= "officemodel" name[]
                "{" elements* "}" ;

Employee ::= "employee" name[]
             "works" "in" worksIn[]
             "works" "with" worksWith[]
             ("," worksWith[])* ;

Office ::= "office" name[];
```

```
officemodel SoftwareTechnology {
  office INF2080
  employee Florian
    works in INF2080
}
```

b)



emftext

Complete Customized Syntax

b)

office.cs

```
SYNTAXDEF office
FOR <http://emftext.org/office>
START OfficeModel

OPTIONS {
    generateCodeFromGeneratorModel = "true";
}

RULES {
    OfficeModel ::= "officemodel" name[]
                    "{" elements* "}" ;

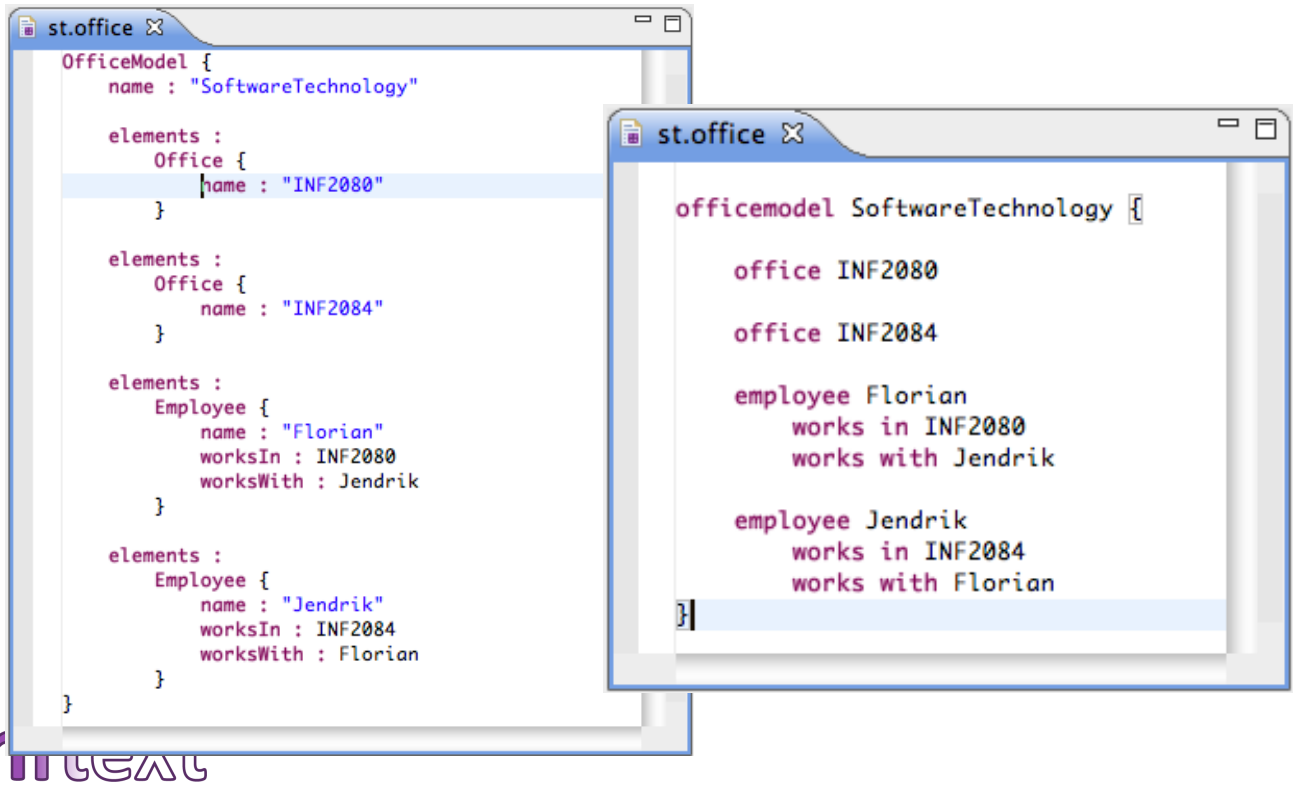
    Office ::= "office" name[];

    Employee ::= "employee" name[]
                 "works" "in" worksIn[]
                 "works" "with"
                 worksWith[] ("," worksWith[])* ;
}
```

emftext

Generic Syntax vs. Custom Syntax

b)



emftext

Advanced Features – Attribute Mapping

c)

Putting strings into EString attributes is easy

How about EInt, EBoolean, EFloat, ..., custom data types?

- Solution A: Default mapping
  The generated classes use the conversion methods provided by Java (java.lang.Integer, Float etc.)

- Solution B: Customize the mapping using a token resolver

```
public void resolve(String lexem, EStructuralFeature feature,
    ITokenResolveResult result) {
  if ("yes".equals(lexem)) result.setResolvedToken(Boolean.TRUE);
  else result.setResolvedToken(Boolean.FALSE);
}
public String deResolve(Object value, EStructuralFeature feature,
    EObject container) {
    if (value == Boolean.TRUE) return "yes"; else return "no";
}
```

emftext

Advanced Features – Resolving Cross References

c)

Well, quite similar to attribute mappings:

- Solution A: Default resolving
  Searches for matching elements that have an ID attribute, a name attribute or a single attribute of type EString and picks the first
  (Works well for simple DSLs without scoping rules)

- Solution B: Custom resolving
  Change the generated resolver class
  (implements IReferenceResolver<ContainerType, ReferenceType>)

  For examples see the resolvers for the Java language

Advanced Features – Syntax Modules

c)

- Import meta models optionally with syntax
- Extend, Combine existing DSLs
- Create embedded DSLs (e.g., for Java)
- Create a template language from your DSL
- ...

java_templates.cs

```
SYNTAXDEF java_template
FOR <http://www.emftext.org/language/java_templates>
START JavaTemplate

IMPORTS {
    java : <http://www.emftext.org/java> <../../org.emftext.language.java/metamodel/java.genmodel>
        WITH SYNTAX java <../../org.emftext.language.java/metamodel/java.cs>
}

OPTIONS {
    usePredefinedTokens = "false";
    overrideManifest = "false";
}
```

Using the DSL – Interpretation vs. Compilation

So far we achieved to

- map input documents (text) to models
- do the inverse

EMFText provides an extension point to perform interpretation (or compilation) whenever DSL documents change

To use the DSL we need to assign meaning by

1. Interpretation
   Traverse the DSL document and perform appropriate actions
2. Compilation
   Translate the DSL constructs to another (possibly executable) language

   (In principle compilation is an interpretation where the appropriate action is to emit code of the target language)

Challenges for MDSD

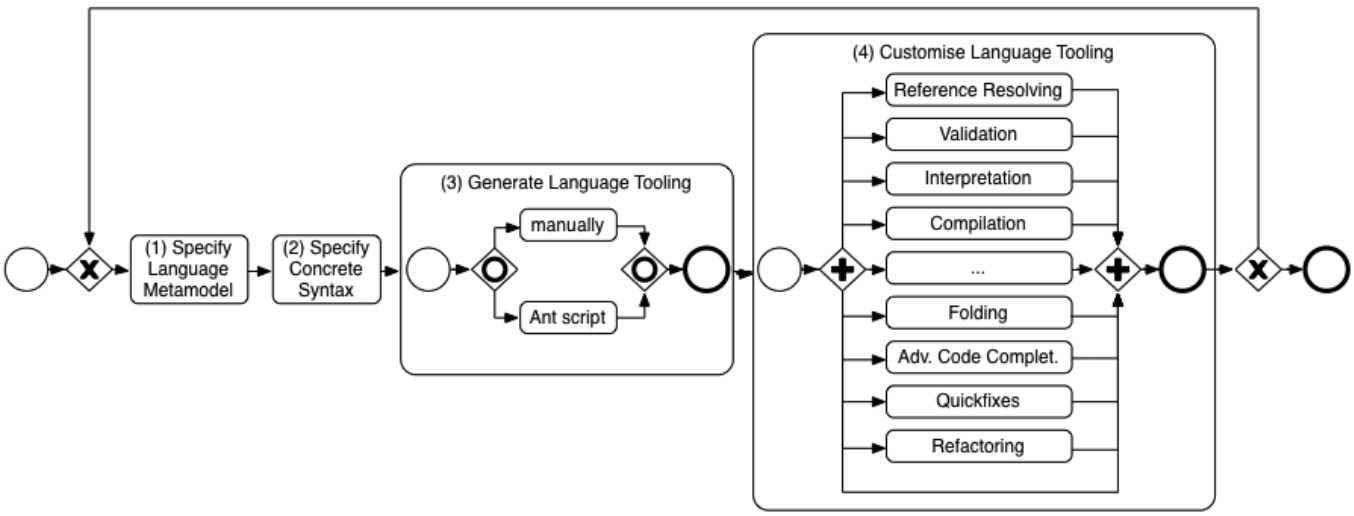
- Developers are required to use different tool machinery for DSLs and GPLs.
- Explicit references between DSL and GPL code are not supported. Their relations are, thus, hard to track and may become inconsistent
- DSLs can not reuse (parts of) the expressiveness of GPLs
- Naive embeddings of DSL code (e.g., in Strings) do not provide means for syntactic and semantic checking
- Interpreted DSL code is hard to debug
- Generated GPL code is hard to read, debug and maintain

Using the DSL – Interpretation vs. Compilation

- Create an interpreter/compiler in Java
  - Initially easy, but hard to maintain
  -
- Use a model transformation
  - ATL, Epsilon, ...
-
- Use a template engine
  - DSL documents are the parameter (models)

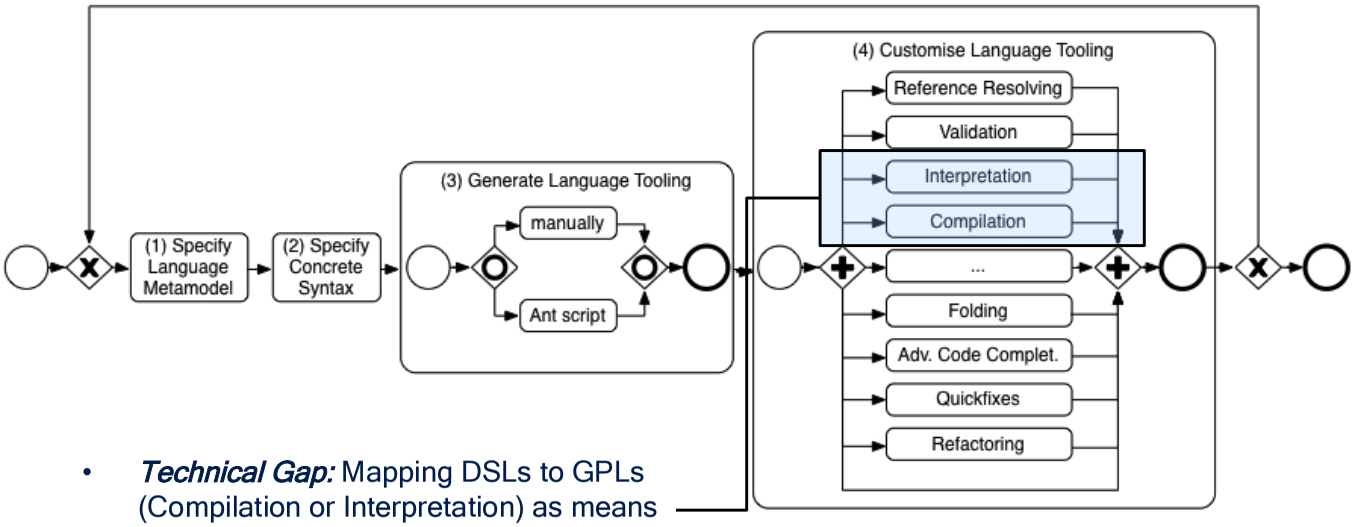
emftext

Integrating DSLs and GPLs



emftext

Integrating DSLs and GPLs



- ***Technical Gap:*** Mapping DSLs to GPLs (Compilation or Interpretation) as means for execution

Integrating DSLs and GPLs

Approach

(1) Use EMFText to *lift* GPLs to the technical space of DSLs
(2) Language integration by metamodel and grammar inheritance

Integrating DSLs and GPLs

Approach

(1) Use EMFText to *lift* GPLs to the technical space of DSLs
(2) Language integration by metamodel and grammar inheritance

JaMoPP: Lifting Java to TS of DSLs

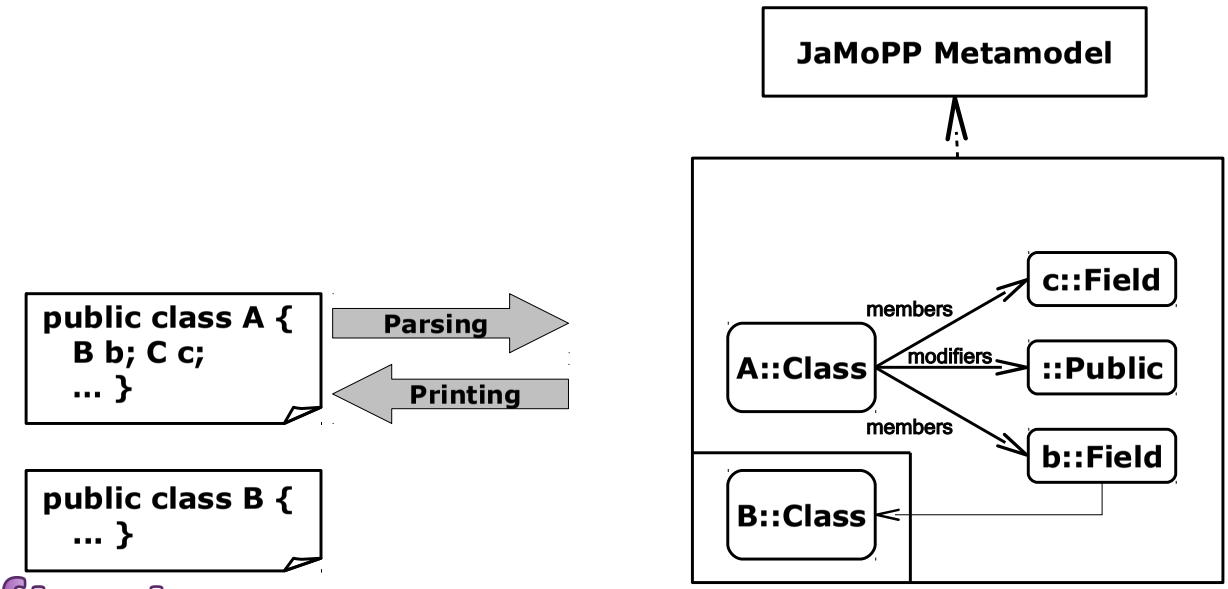
- Ingredients:

JaMoPP: Lifting Java to TS of DSLs

- Ingredients:
  - Ecore Metamodel for Java 5 (153 concrete, 80 abstract classes)

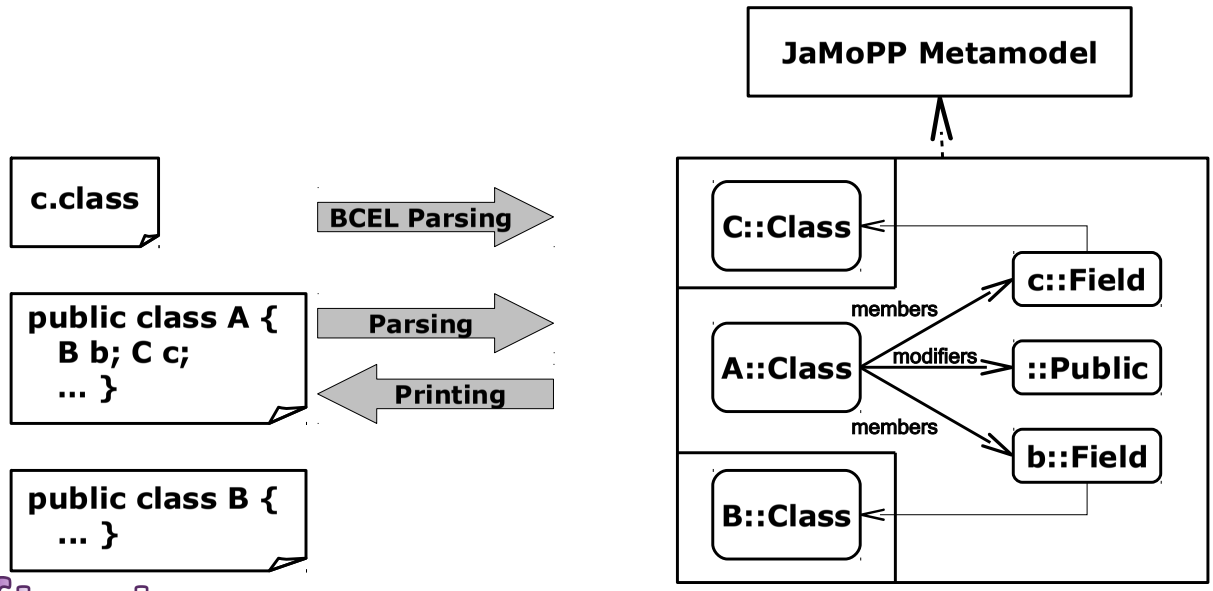
JaMoPP: Lifting Java to TS of DSLs

- Ingredients:
  - Ecore Metamodel for Java 5 (153 concrete, 80 abstract classes)
  - EMFText .cs definition for each concrete class



JaMoPP: Lifting Java to TS of DSLs

- Ingredients:
  - Ecore Metamodel for Java 5 (153 concrete, 80 abstract classes)
  - EMFText .cs definition for each concrete class
  - BCEL Bytecode-Parser – to handle third-party libraries

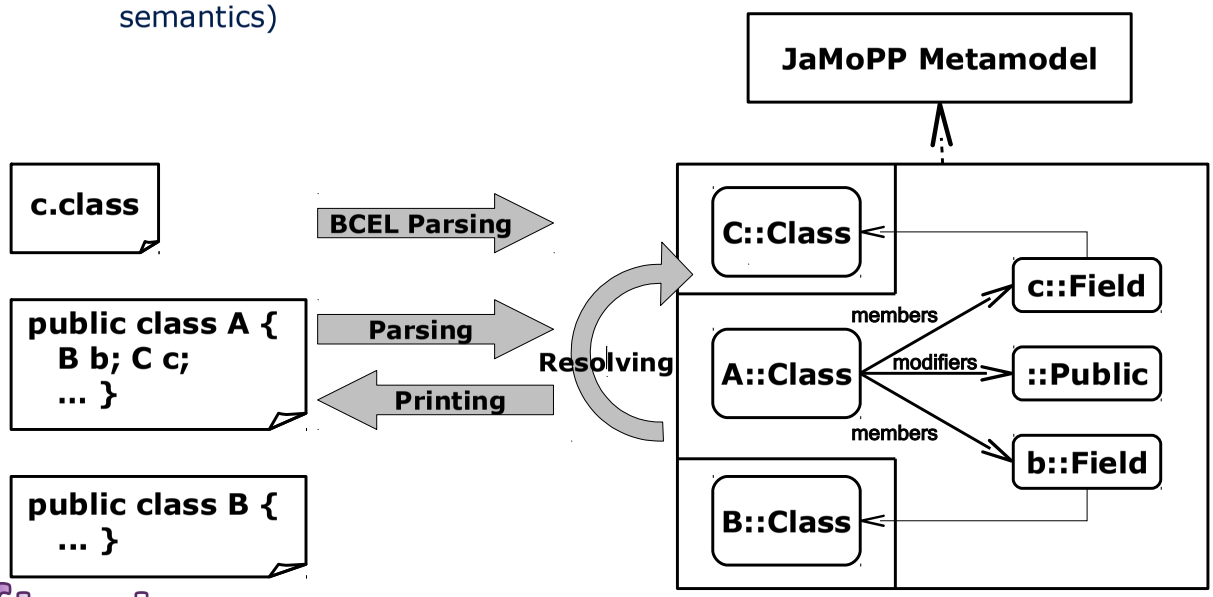


emftext

TECHNISCHE UNIVERSITÄT DRESDEN

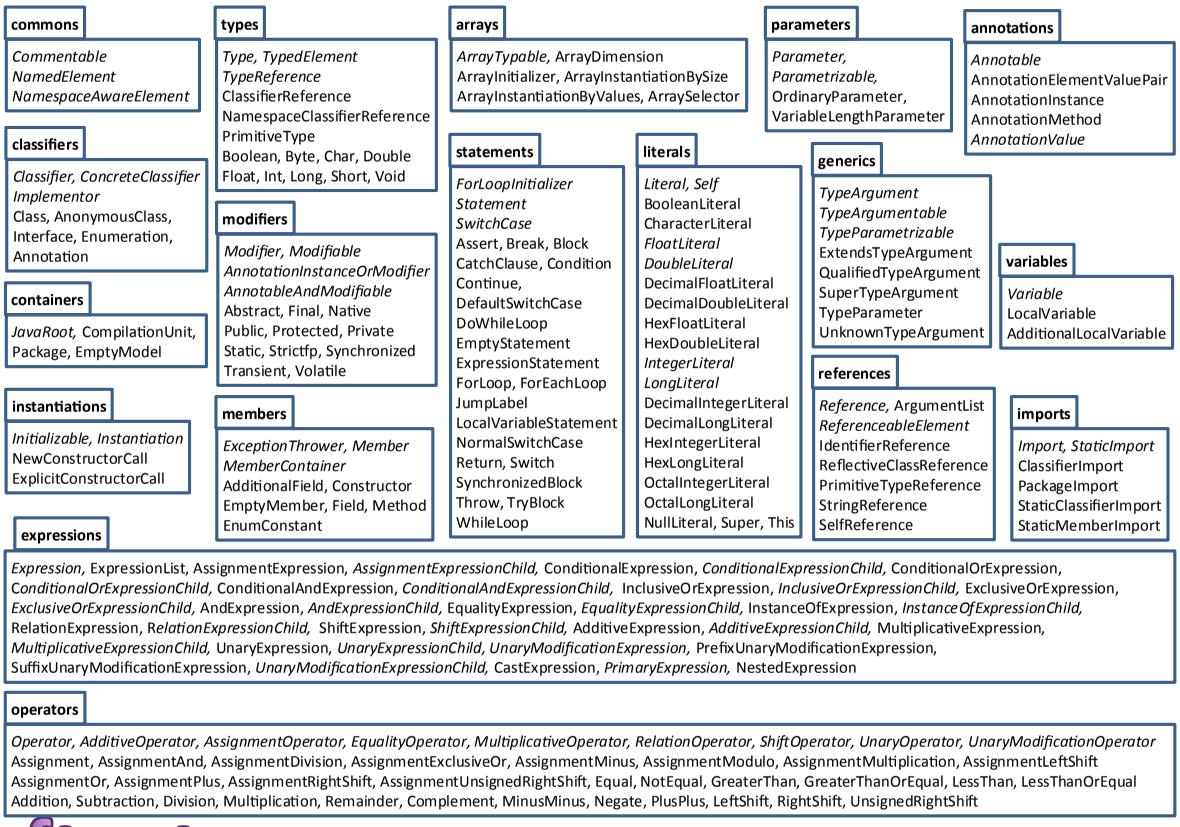
JaMoPP: Lifting Java to TS of DSLs

- Ingredients:
  - Ecore Metamodel for Java 5 (153 concrete, 80 abstract classes)
  - EMFText .cs definition for each concrete class
  - BCEL Bytecode-Parser – to handle third-party libraries
  - Reference Resolvers that implement java-specific scoping (static semantics)



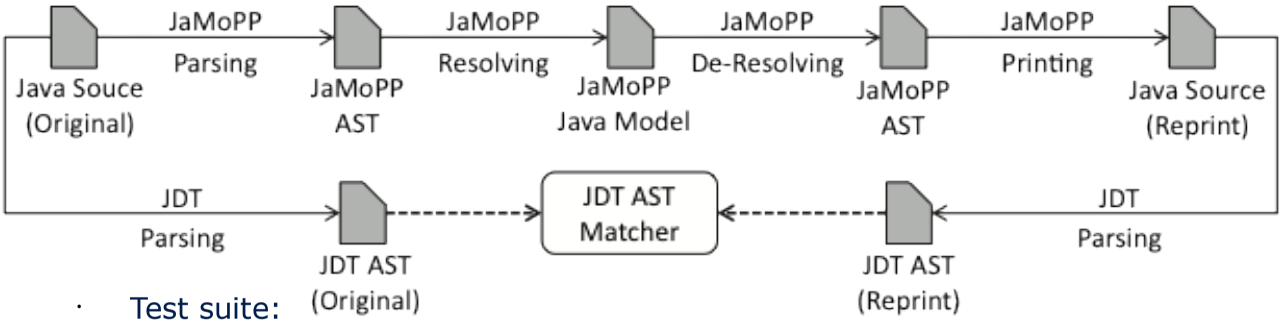
emftext

JaMoPP Metamodel



JaMoPP Testing

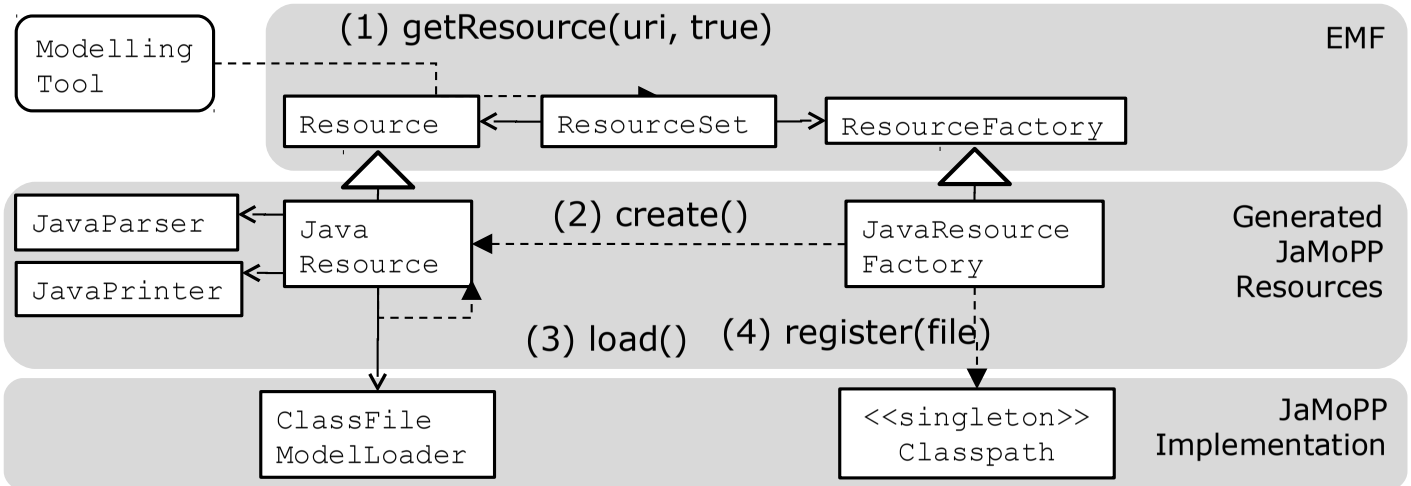
- Parsing public class A is easy, but parsing Java 5 is not (Unicode, Generics, Annotations and lots of weird things allowed by the JLS)
- We wanted JaMoPP to be complete



- Test suite:
  - 88.595 Java files (14.7 million non-empty lines including comments)
  - Open Source projects:
    AndroMDA 3.3, Apache Commons Math 1.2, Apache Struts 2.1.6, Apache Tomcat 6.0.18, Eclipse 3.4.1, Google Web Toolkit 1.5.3, JBoss 5.0.0 GA, Mantissa 7.2, Netbeans 6.5, Spring 3.0.0M1, Sun JDK 1.6.0 Update 7, XercesJ 2.9.1

JaMoPP Tool Integration

- JaMoPP seamlessly and transparently integrates with arbitrary EMF-based Tools



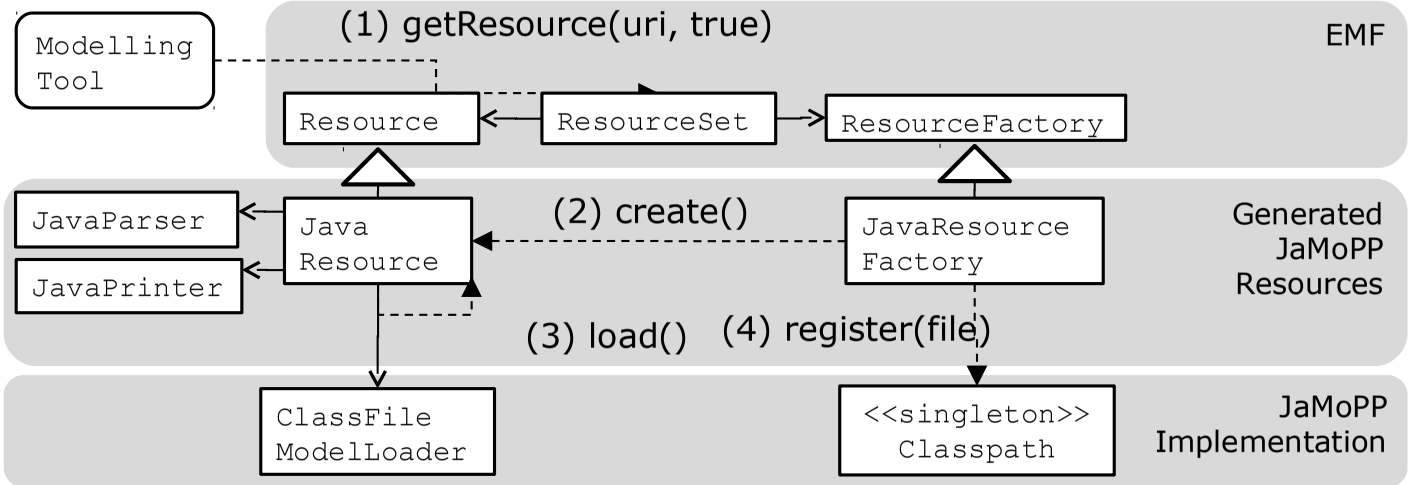
- Parsing Java files to models and Printing Java Files is simple

emftext

TECHNISCHE UNIVERSITÄT DRESDEN

JaMoPP Tool Integration

- JaMoPP seamlessly and transparently integrates with arbitrary EMF-based Tools



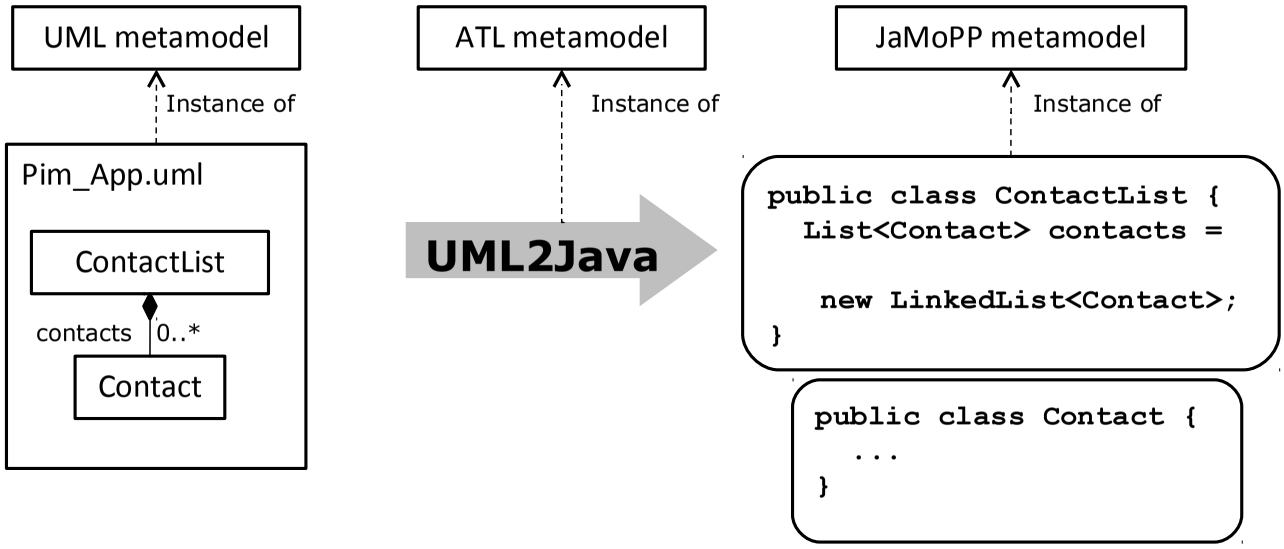
- Parsing Java files to models and Printing Java Files is simple

```
ResourceSet rs = new ResourceSetImpl();
Resource javaResource = rs.getResource(URI.createFileURI("A.java"),true); //parsing
javaResource.save(); // printing
```

emftext

JaMoPP Application: Code Generation (ATL)

- Design UML model, apply M2M transformation, print JaMoPP model
- Syntactic and semantic correctness



emftext

JaMoPP Application: Code Generation (ATL)

- Design UML model, apply M2M transformation, print JaMoPP model

```
rule Property {
   from umlProperty : uml!Property
   to javaField : java!Field (
     name <- umlProperty.name,
     type <- typeReference
   ),

   typeReference : java!TypeReference (
     target <- if (umlProperty.upper = 1) then umlProperty.type
       else
         java!Package.allInstances()->any(p | p.name = 'java.lang').compilationUnits->collect(
           cu | cu.classifiers)->flatten()->any(c | c.name = 'LinkedList')
       endif,
     typeArguments <- if (umlProperty.upper = 1) then
         Sequence{} -- empty type argument list
       else
         Sequence{typeArgument}
       endif
   ),

   typeArgument : java!QualifiedTypeArgument(
     target <- umlProperty.type
   )
 }
```

emftext

JaMoPP Application: Code Analysis (OCL)

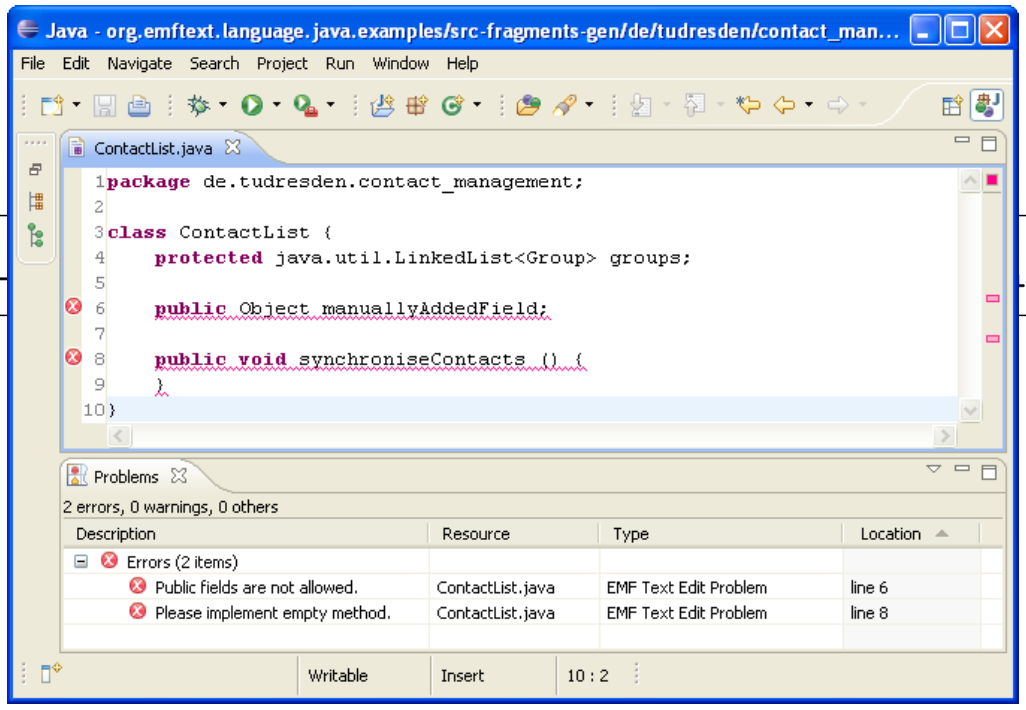
- Parse Java source files to model instances
- Run OCL queries to find undesired patterns

```
context members::Field inv:
   self->modifiers->select(m|m.oclIsKindOf(modifiers::Public))->size() = 0
```

TECHNISCHE UNIVERSITÄT DRESDEN

JaMoPP Application: Code Analysis (OCL)

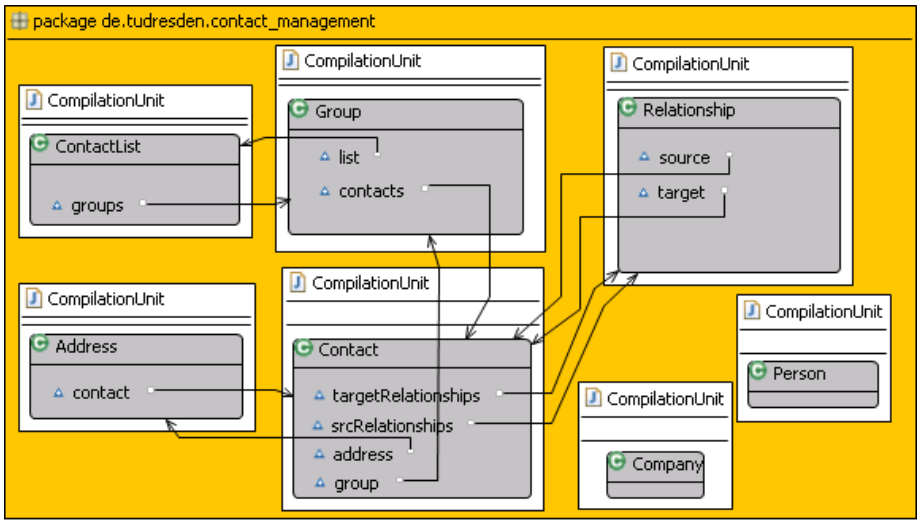
- Parse Java source files to model instances
- Run OCL queries to find undesired patterns



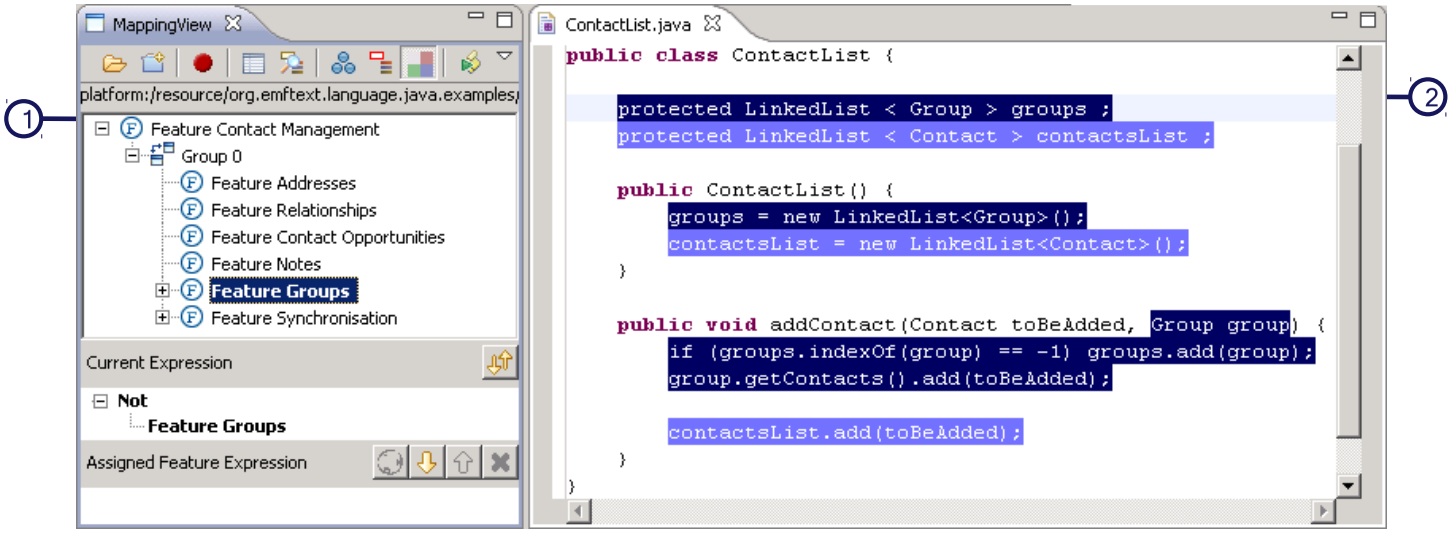
```
context
   self-                                                    ze() = 0
```

JaMoPP Application: Code Visualization (GMF)

- Create .gmfgraph, gmftool, and gmfmap model
- Generate Graphical Editor for Java



JaMoPP Application: Software Product Line Engineering (FeatureMapper)



1 – Feature Model
2 – EMFText Editor for Java (code for feature highlighted)

JaMoPP Applications: What else?

- Typesafe Template Languages
  - Same syntax as string-based templates
- Round-trip Support for template-based code generators
- Refactoring, Optimization using model transformations
- Traceability-related activities
  - Certification (Map code to the model elements)
  - Impact analysis (How much of the code will change if I do this?)
- Model-based compilation to byte code
- …

emftext

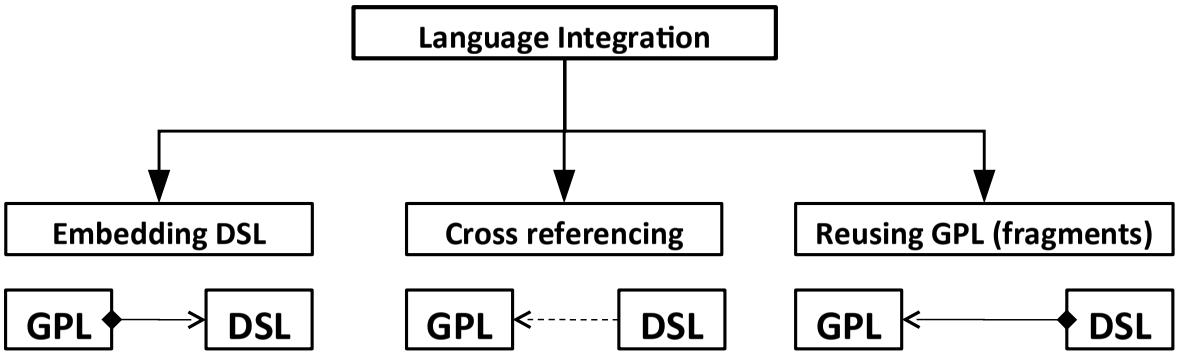
Integrating DSLs and GPLs

Approach

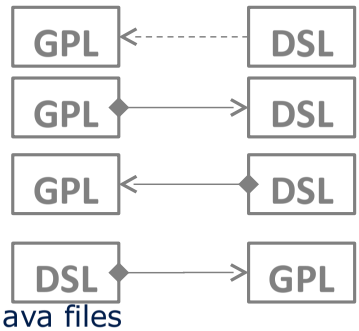
(1) Use EMFText to *lift* GPLs to the technical space of DSLs
(2) Language integration by metamodel and grammar inheritance

Integrating DSLs and GPLs

- Different integration scenarios



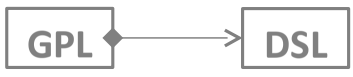
Language Integration Examples



- FormsExtension
- FormsEmbedded
- JavaForms

- eJava
  - Provides metamodels with Eoperations
  - implementations without touching the generated java files

- JavaTemplate
  - Syntax safe templates with JaMoPP



- PropertiesJava
  - Experimental extension for Java to define C# like properties

- JavaBehaviour4UML
  - An integration of JaMoPP and the UML
  - Methods can be directly added to Classes in class diagrams

The EMFText Syntax Zoo (>90 residents)

- Ecore, KM3 (Kernel Meta Meta Model)
- Quick UML, UML Statemachines
- Java 5 (complete), C# (in progress)

- Feature Models
- Regular Expressions

- OWL2 Manchester Syntax

- Java Behavior4UML

- DOT (Graphviz language)

…and lots of example DSLs

http://emftext.org/zoo

Conclusion

- Few concepts to learn before using EMFText
- Creating textual syntax for new languages is easy, for existing ones it is harder, but possible (we did Java)
- Rich tooling can be generated from a syntax definition
- Textual and graphical syntax can complement each other (e.g., to support version control)
- Semantics (Interpretation/Compilation) must be defined manually – At most it can be reused

Language is the blood of the soul into which thoughts run
and out of which they grow.

(Oliver Wendell Holmes)

Thank you!
