Object-Oriented Analysis vs Object-Oriented Design

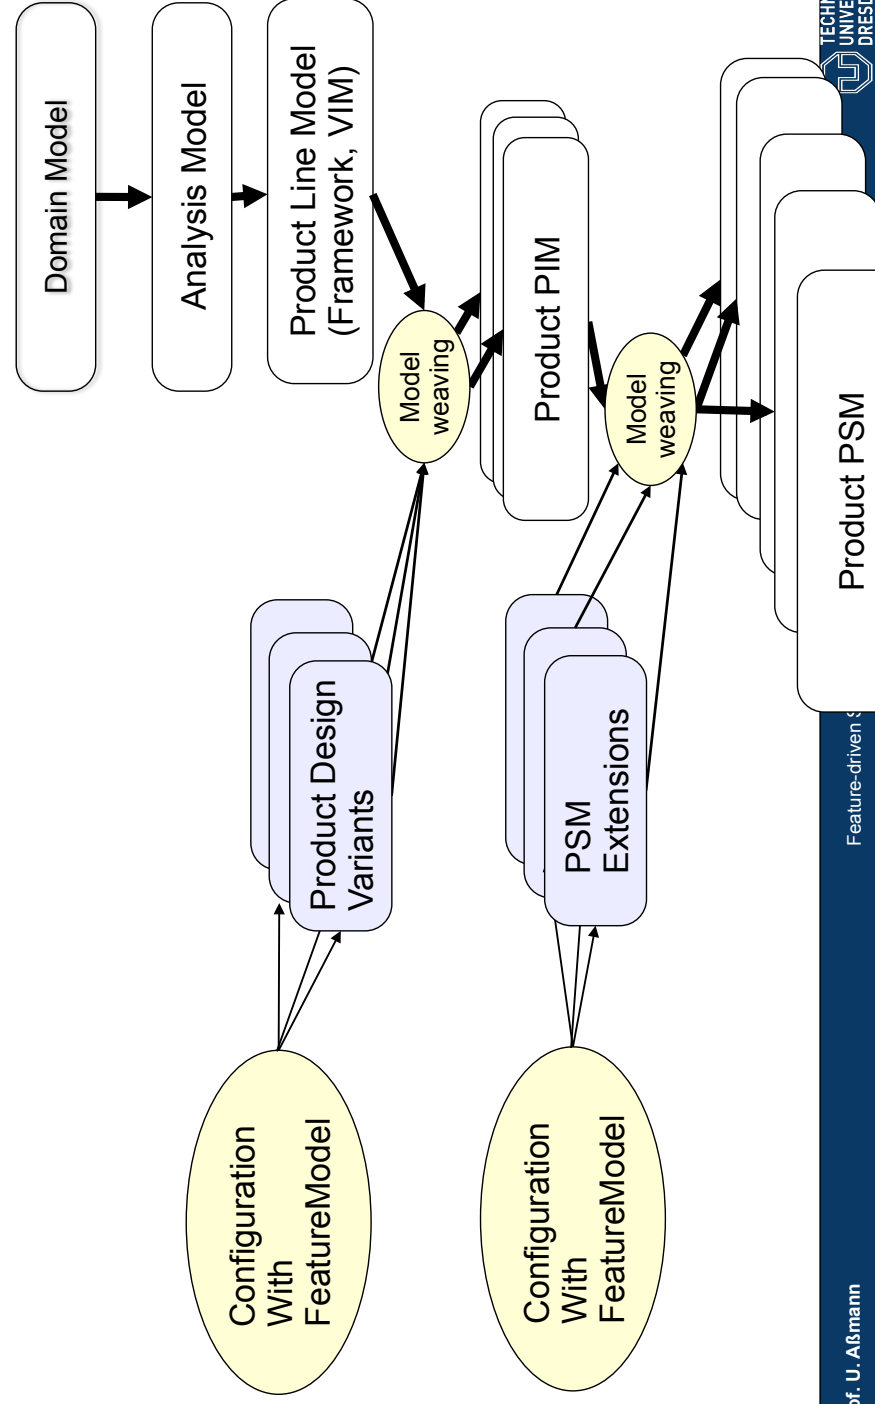

- In the following, we extend the MDA (below) with configuration

- The VIM (variant independent model) is the common model of the product family

31.1 PRODUCT LINES WITH FEATURE TREES AND FEATURE MODELS

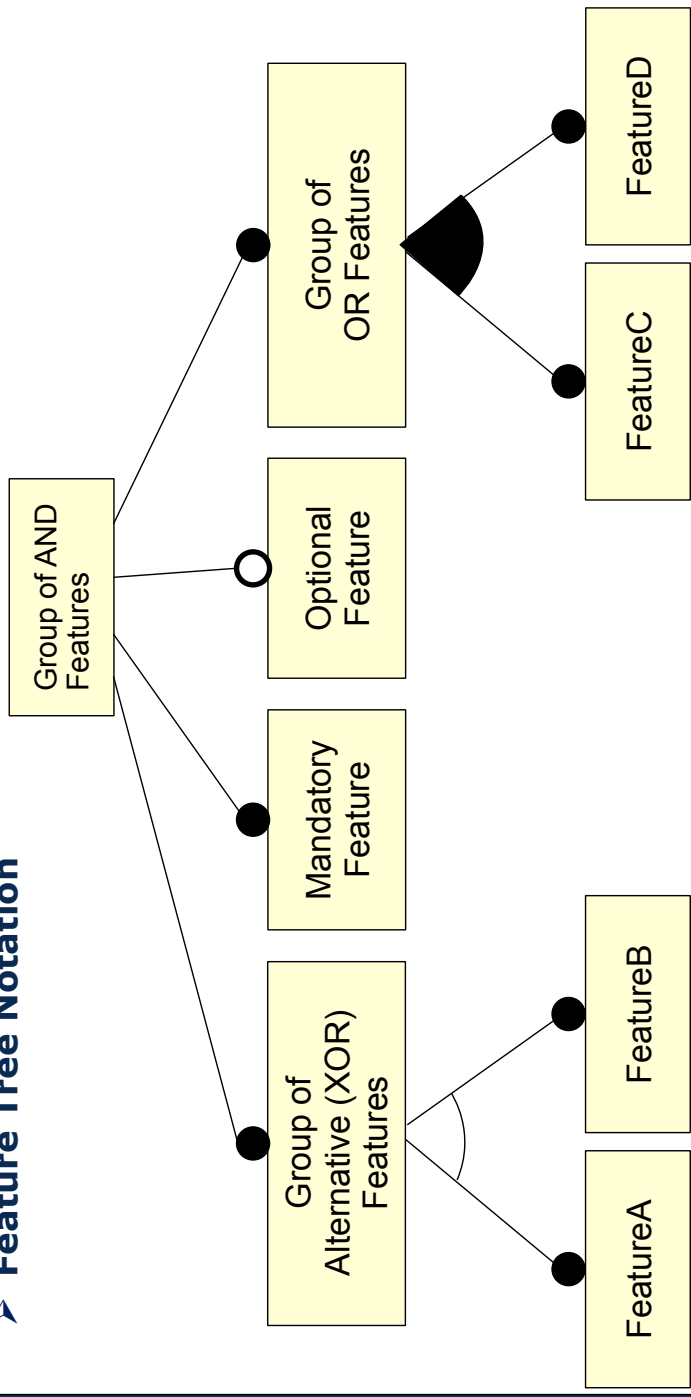

Feature Models for Product configuration

- **Feature models are used to express variability in Product Lines**
 - alternative,
 - mandatory,
 - optional features, and
 - their relations

- **A *variant model* represents a concrete product from the product line**
 - The variant model results from a selection of a subgraph of the feature model
 - The variant model can be used to parameterize and drive the product instantiation process

➤ Feature Tree Notation

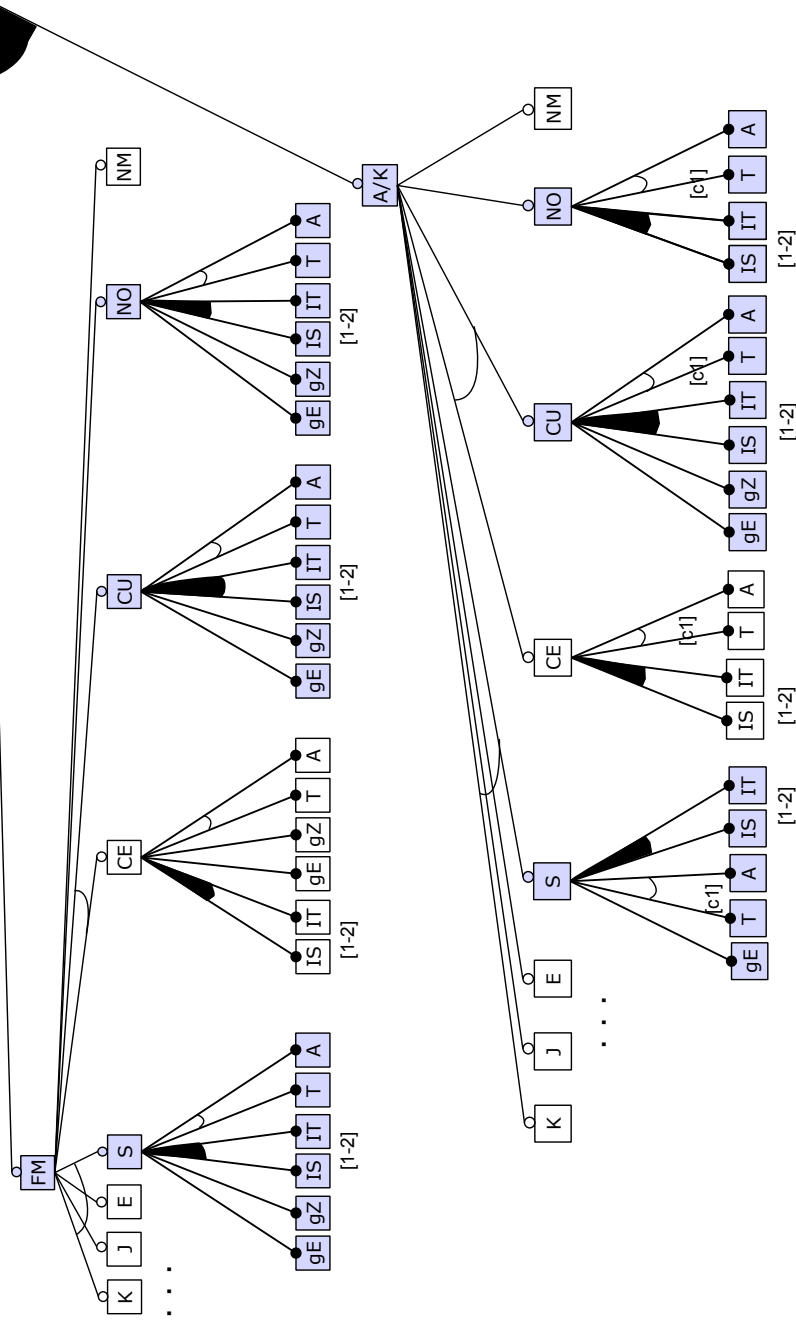

PhD Thesis, Czarnecki (1998)
based on FODA-Notation by Kang et al. (1990)

Beispiel

- **A1 or A2 or A3**
- **B1; B2 xor B3**
- **B4; optional B5**
- **B1; B7**

➤ [K. Lehmann, Diplomarbeit]

Mapping Features to Model Fragments (Model Snippets)

- **Bridging the gap between configuration and solution space**
- **Need for mapping of features from feature models to artefacts of the solution space**
- **Possible artefacts**
 - Models defined in DSLs
 - Model fragments (snippets)
 - Architectural artefacts (components, connectors, aspects)
 - Source code
 - Files
- **But how can we achieve the mapping... ?**

Ex: Plugins have Features (in Eclipse)

Plugins and Fragments

Plug-ins and Fragments

Select plug-ins and fragments that should be packaged in this feature.

- org.eclipse.core.filesystem.linux.ppc (1.0.100.v20080604-1400)
- org.eclipse.core.filesystem.linux.x86 (1.2.0.v20080604-1400)
- org.eclipse.core.filesystem.linux.x86_64 (1.0.100.v20080604-1400)
- org.eclipse.core.filesystem.macosx (1.1.0.v20090112)
- org.eclipse.core.filesystem.solaris.sparc (1.0.100.v20080604-1400)
- org.eclipse.core.filesystem.win32.x86 (1.1.0.v20080604-1400)
- org.eclipse.core.resources.win32.x86 (3.5.0.v20081020)
- org.eclipse.equinox.launcher.carbon.macosx (1.0.200.v20090520-1835)
- org.eclipse.equinox.launcher.gtk.linux.ppc (1.0.200.v20090519)
- org.eclipse.equinox.launcher.gtk.linux.x86 (1.0.200.v20090520)
- org.eclipse.equinox.launcher.gtk.linux.x86_64 (1.0.200.v20090519)
- org.eclipse.equinox.launcher.gtk.solaris.sparc (1.0.200.v20090519)
- org.eclipse.equinox.launcher.win32.win32.x86 (1.0.200.v20090519)
- org.eclipse.equinox.security.macosx (1.1.0.0.v20090520-1800)
- org.eclipse.equinox.security.win32.x86 (1.0.100.v20090520-1800)
- org.eclipse.swt.carbon.macosx (3.5.0.v3550b)
- org.eclipse.swt.gtk.linux.ppc (3.5.0.v3550b)
- org.eclipse.swt.gtk.linux.x86 (3.5.0.v3550b)
- org.eclipse.swt.gtk.linux.x86_64 (3.5.0.v3550b)
- org.eclipse.swt.gtk.solaris.sparc (3.5.0.v3550b)
- org.eclipse.ui.carbon (4.0.0.I20090525-2000)
- org.eclipse.ui.win32 (3.2.100.v20090429-1800)
- org.eclipse.update.core.linux (3.2.100.v20081008)
- org.eclipse.update.core.win32 (3.2.100.v20080107)

Total: 25

Plug-in Details

Specify installation details for the selected plug-in.

Add...
Versions...

Name: Core File System For Linux PPC
 Version: 1.0.100.v20080604-1400
 Download Size (KB): 0
 Installation Size (KB): 0

Unpack the plug-in archive after the installation

Specify environment combinations in which the selected plug-in can be installed. Leave blank if the plug-in does not contain platform-specific code.

Overview | Information | Plug-ins | Included Features | Dependencies | Installation | Build | Feature.xml | build.properties

31.2 PRODUCT-LINE CONFIGURATION WITH FEATURE MODELS

- Map all features to model fragments (model snippets)
- Compose them with a core model based on the presence of the feature in the variant model

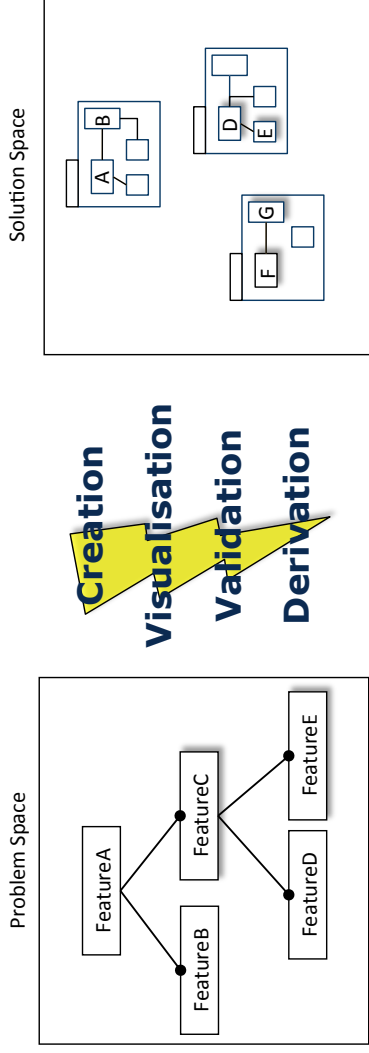

- Pros:
 - conflicting variants can be modelled correctly
 - strong per-feature decomposition
- Cons:
 - traceability problems
 - increased overhead in linking the different fragments

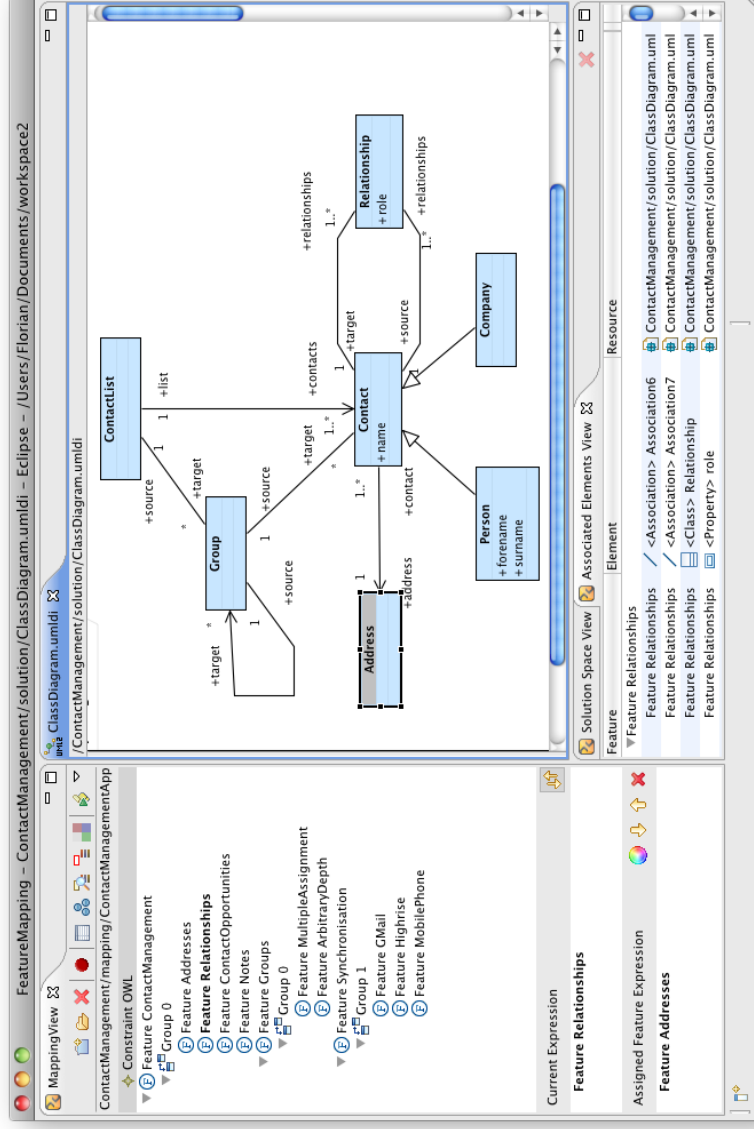

- Model all features in one model
- Remove elements based on absence of the feature in the variant model

- Pros:
 - no need for redundant links between artifacts
 - short cognitive distance
- Cons:
 - conflicting variants can't be modelled correctly
 - huge and inconcise models

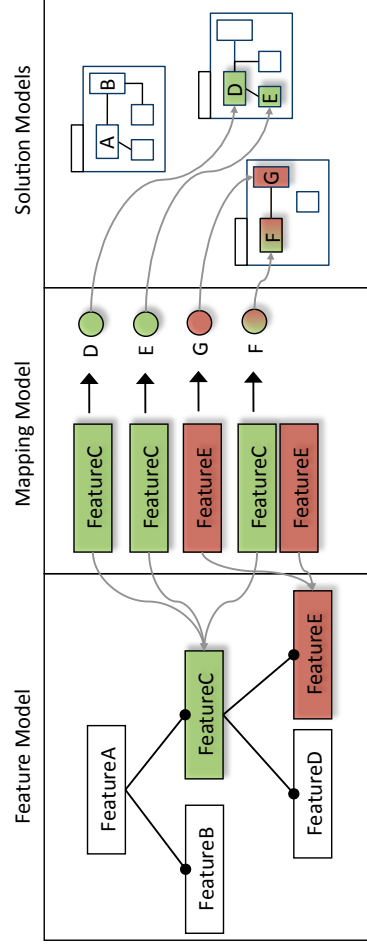

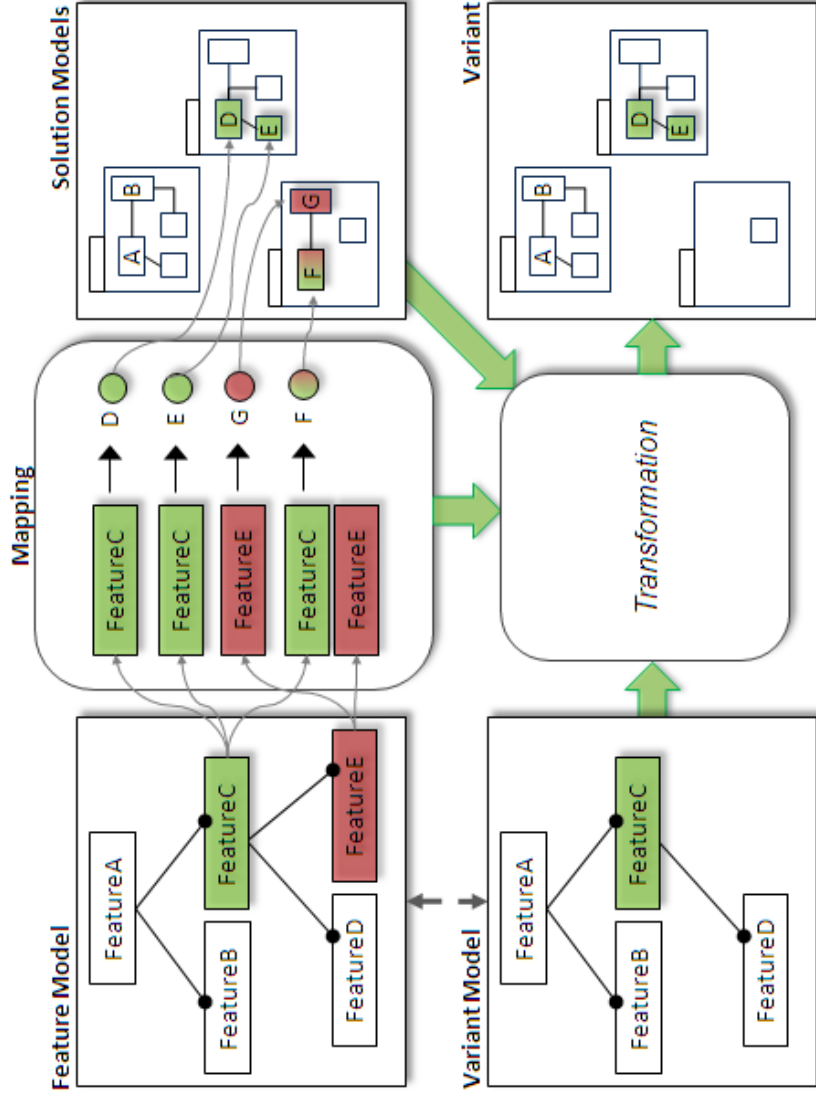

- **FeatureMapper - a tool for mapping of feature models to modelling artefacts developed at the ST Group**
- **Screenecast and paper available at <http://featuremapper.org>**
- **Advantages:**
 - Explicit representation of mappings
 - Configuration of large product lines from selection of variants in feature trees
 - Customers understand
 - Consistency of each product in the line is simple to check
 - Model and code snippets can be traced to requirements

Mapping Features to Models

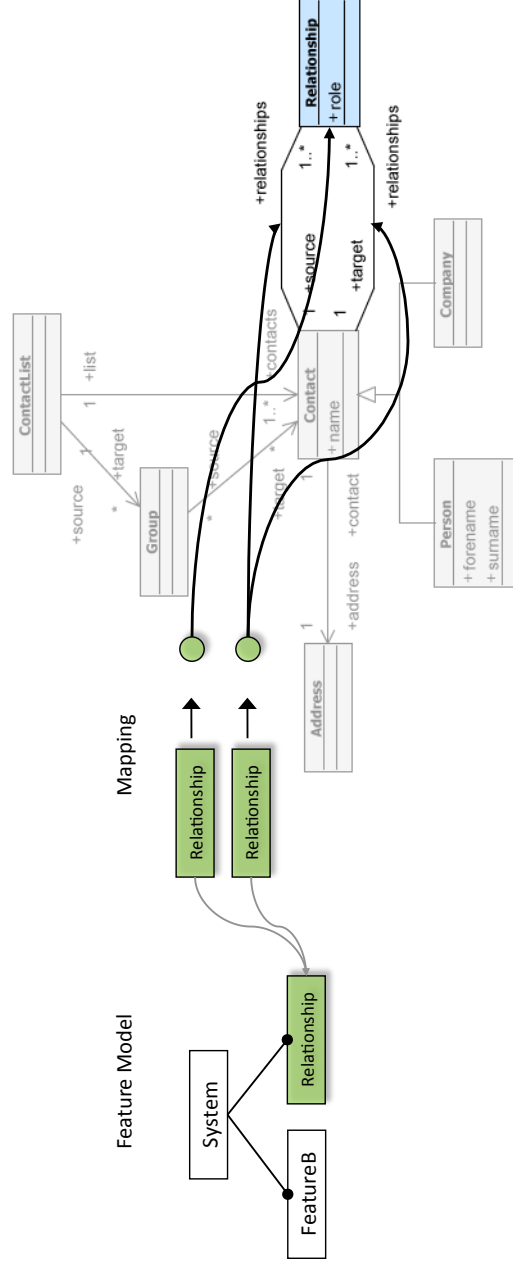

- We chose an explicit *Mapping Representation* in our tool **FeatureMapper**
- Mappings are stored in a mapping model that is based on a mapping metamodel

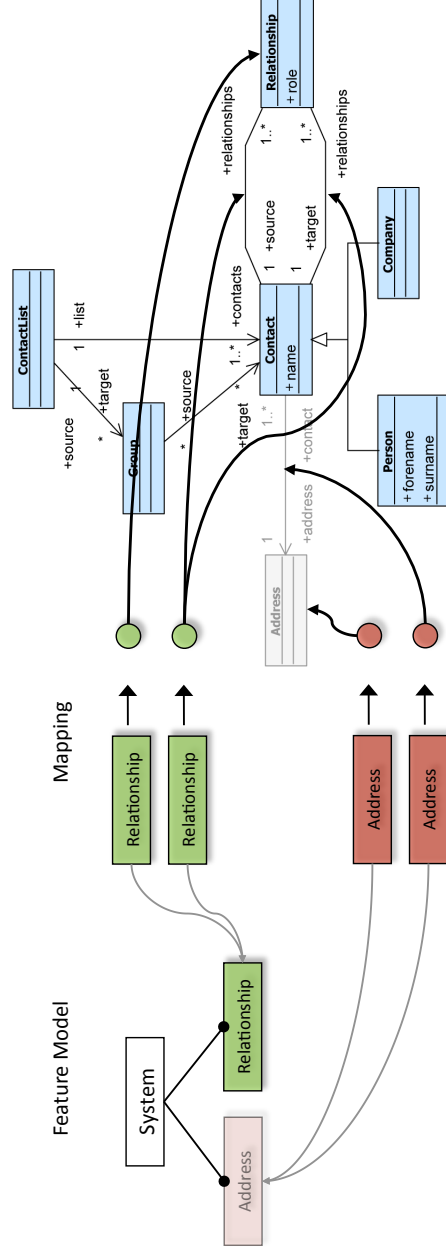

- **Visualisations play a crucial role in Software Engineering**
 - It's hard to impossible to understand a complex system unless you look at it from different points of view
- **In many cases, developers are interested only in a particular aspect of the connection between a feature model and realising artefacts**
 - How a particular feature is realised?
 - Which features communicate or interact in their realisation?
 - Which artefacts may be effectively used in a variant?
- **Solution of the FeatureMapper: MappingViews, a visualisation technique that provides four basic visualisations**
 - Realisation View
 - Variant View
 - Context View
 - Property-Changes View

➤ For one Variant Model, the realisation in the solution space is shown

➤ The variant view shows different realisations in parallel

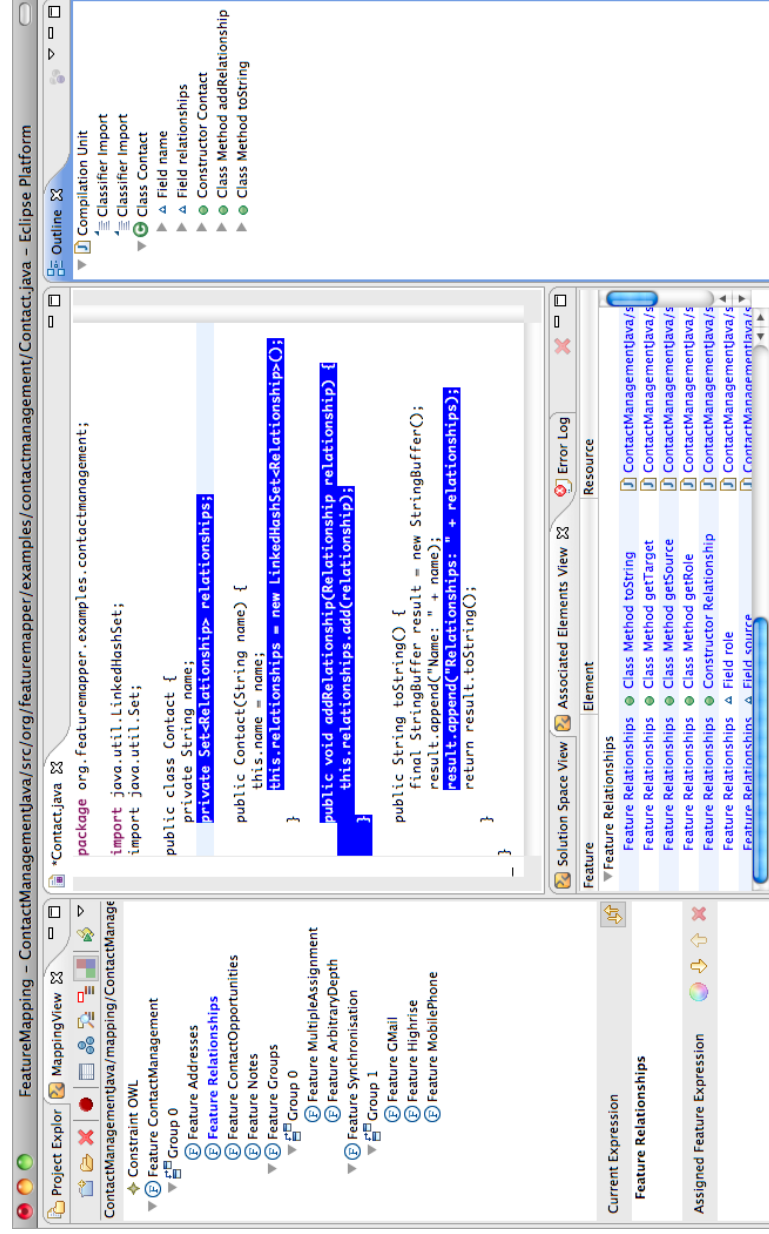

- Unified handling of modelling languages and textual languages by lifting textual languages to the modelling level with the help of EMFText
- All >80 languages from the EMFText Syntax Zoo are supported, including Java 5
- <http://emftext.org>

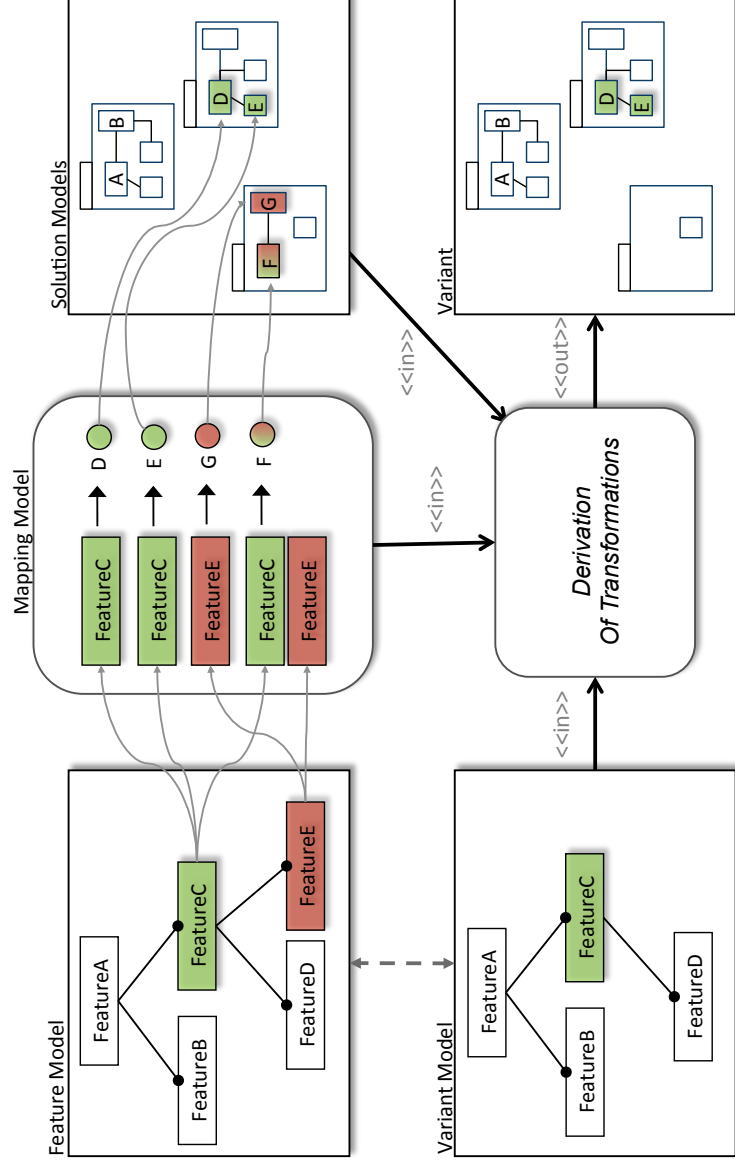

emftext

concrete syntax mapper

- Aspect-related color markup of the code

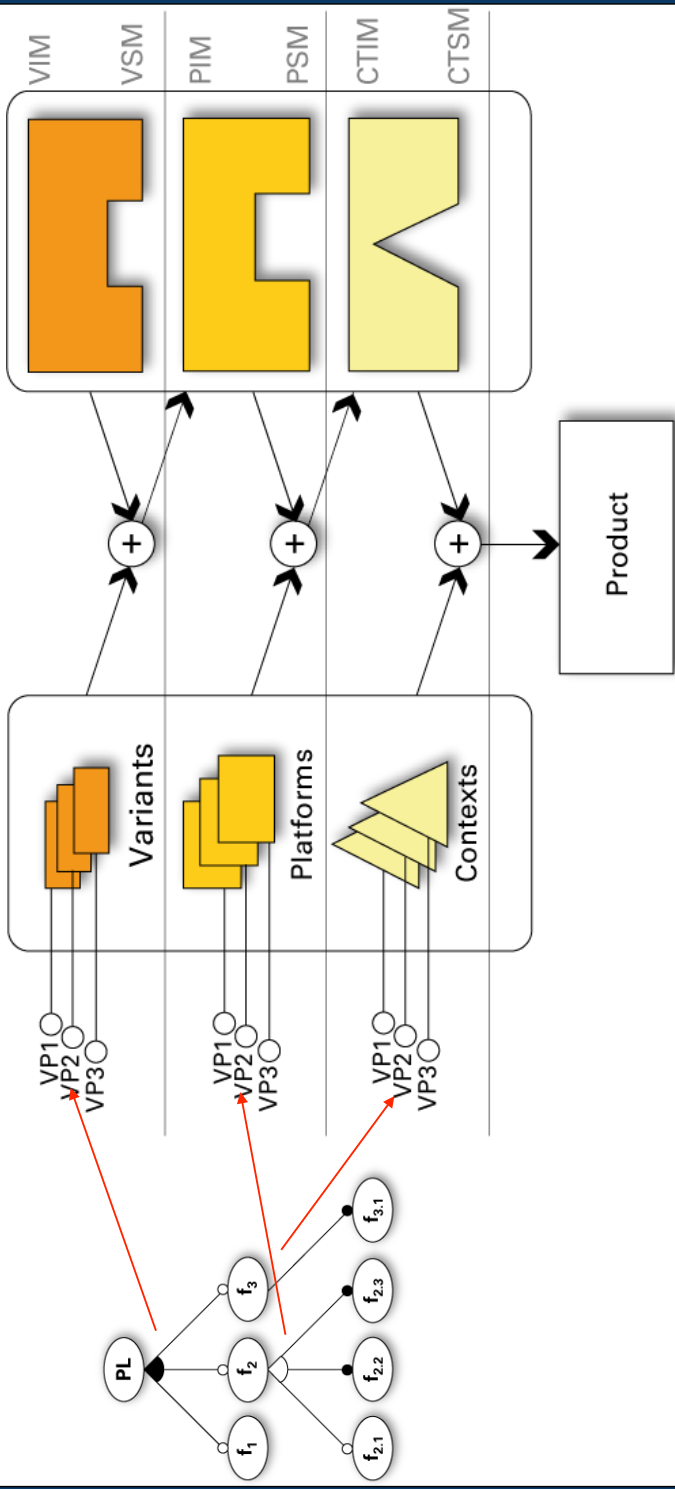

➤ Transformations in the solution space build the product

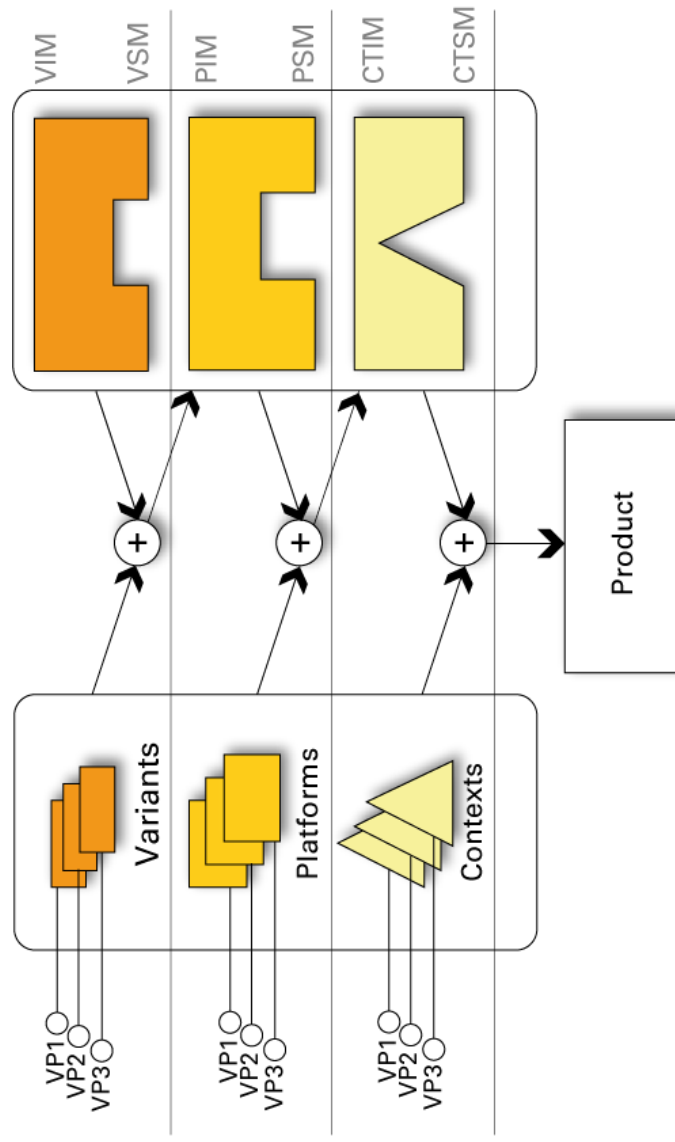

31.3 MULTI-STAGE CONFIGURATION

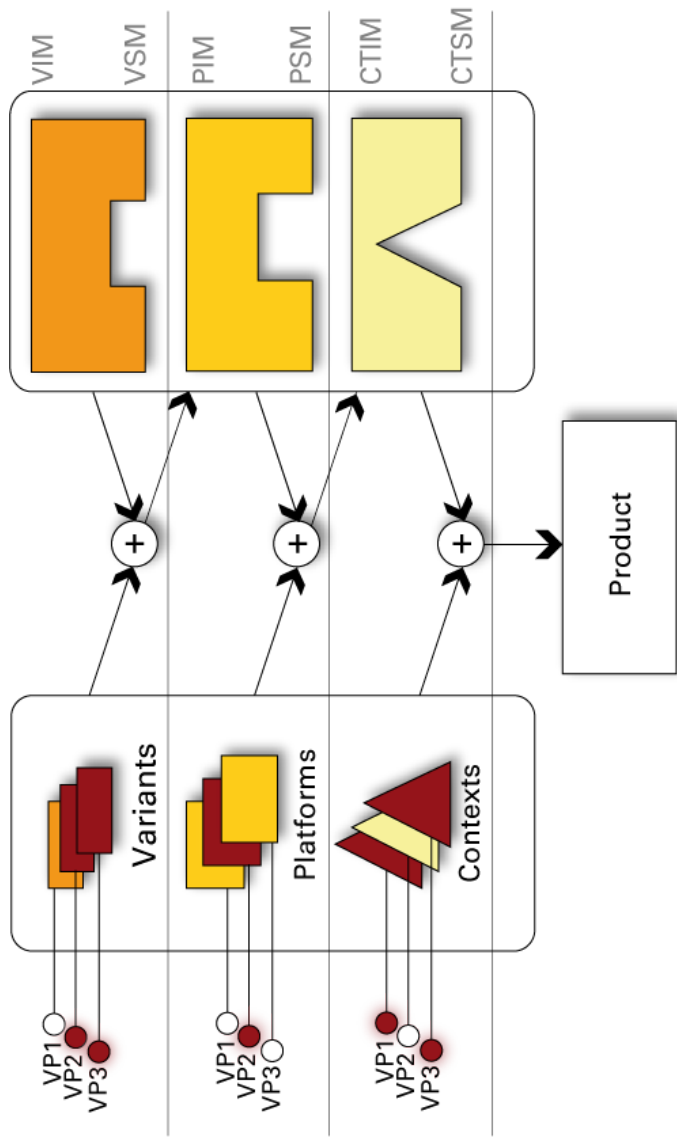

- Chose one variant on each level
- Feature Tree as input for the configuration of the model weavings

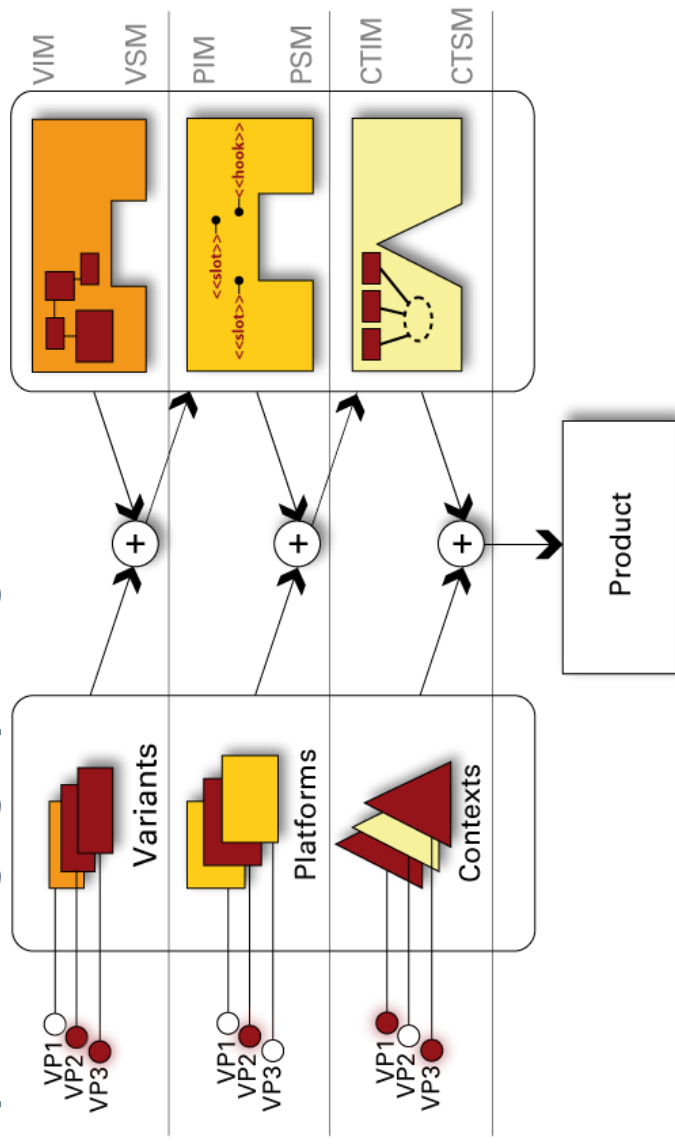

- Goal: a staged MDSD-framework for PLE where each stage produces the software artefacts used for the next stage

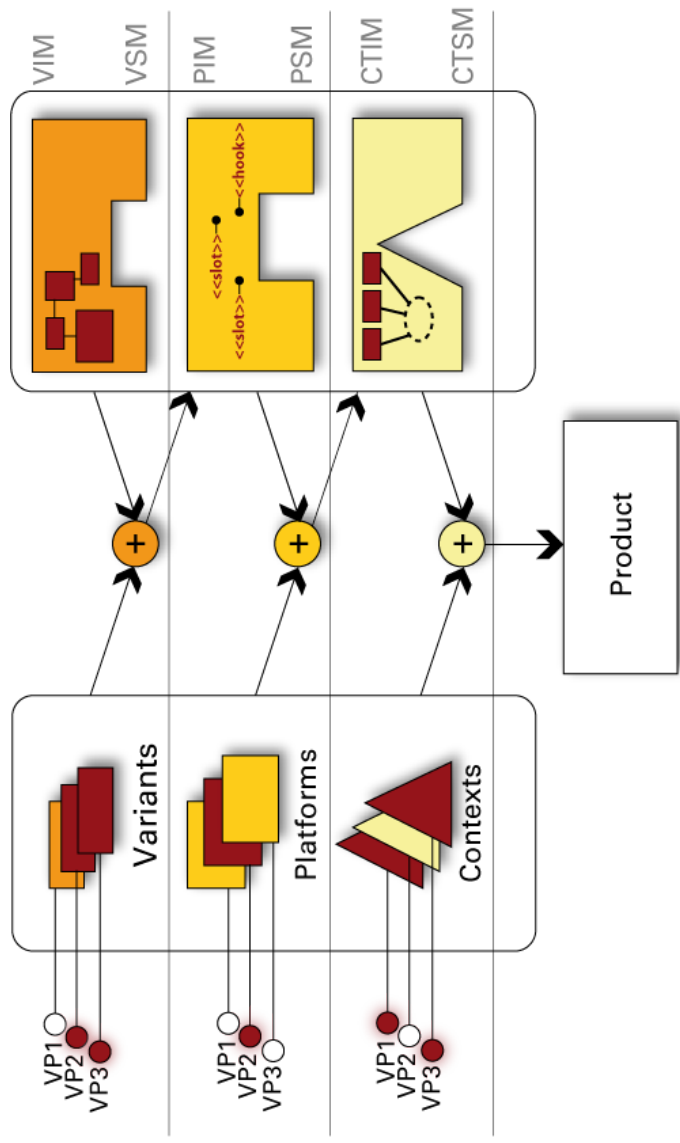

- **Characteristic feature 1:**
- **Variability on each stage**

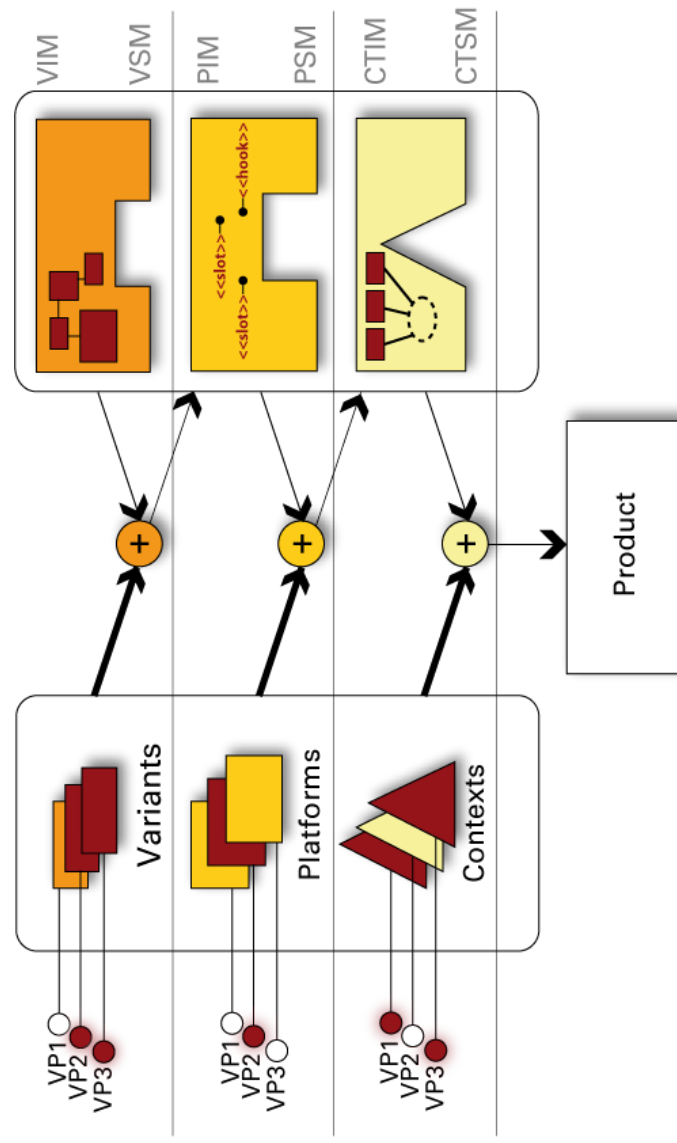

- **Characteristic feature 2:**
- **Different modelling languages, component systems and composition languages per stage**

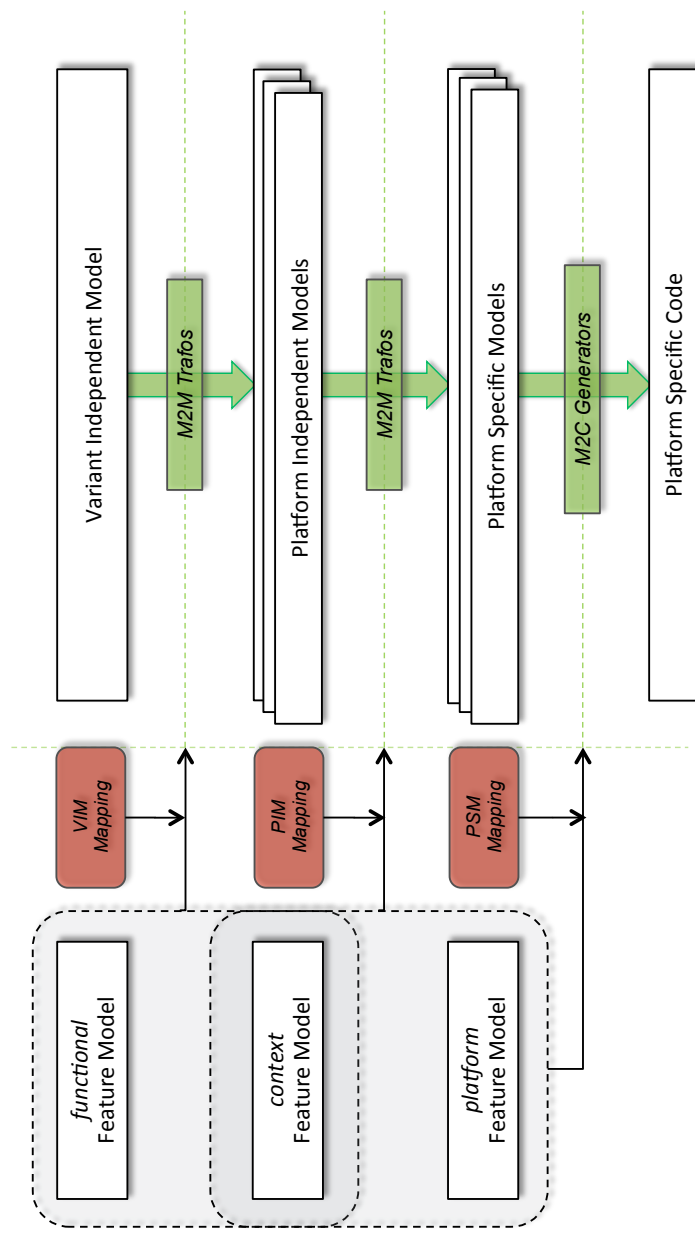

- **Characteristic feature 3:**
- **Different composition mechanisms per stage**

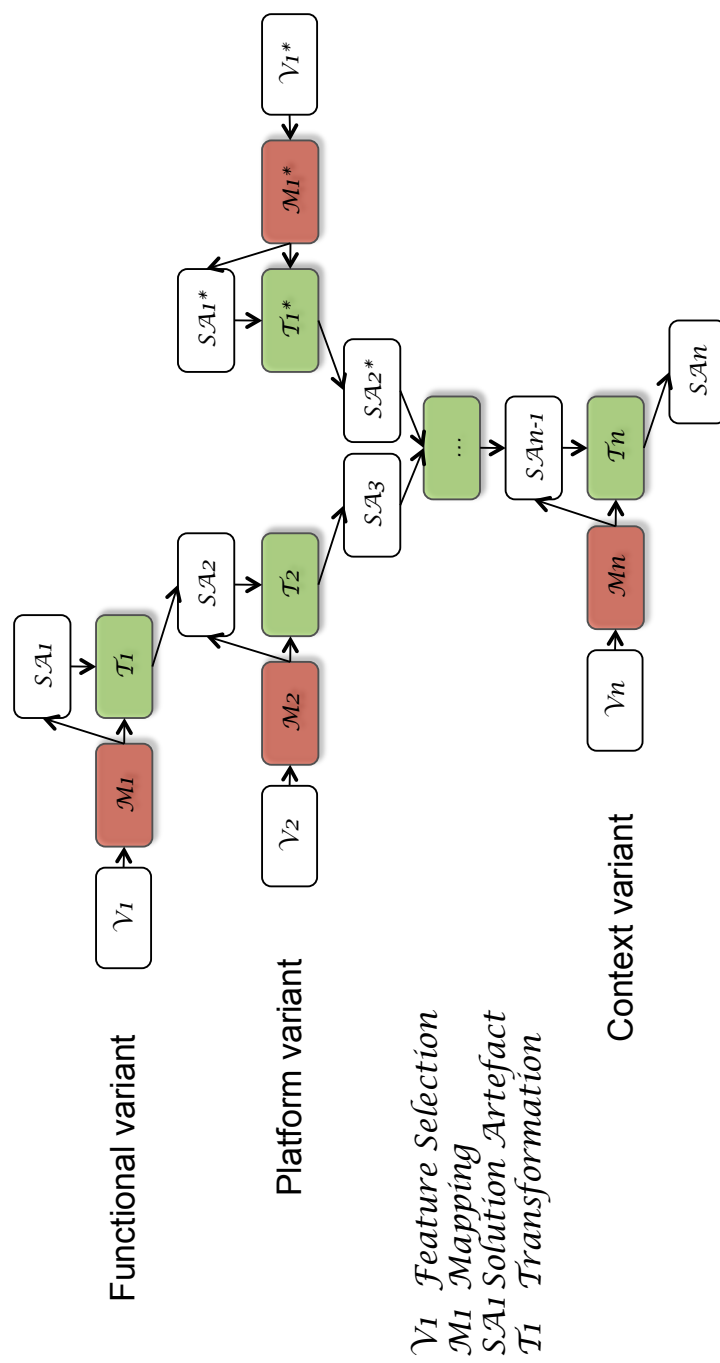

- **Characteristic feature 4:**
- **Composition mechanisms are driven by variant selection**

➤ How do we compose transformations? Between different stages?

- **TraCo encapsulates transformations into composable components**
- Arranges them with *composition programs* of parallel and sequential transformation steps (multi-threaded transformation)

1. Transformations are represented as composable components

2. Definition and Composition of Transformation Steps

- A *Composition System* is needed (course CBSE): Allows for reuse of arbitrary existing transformation techniques

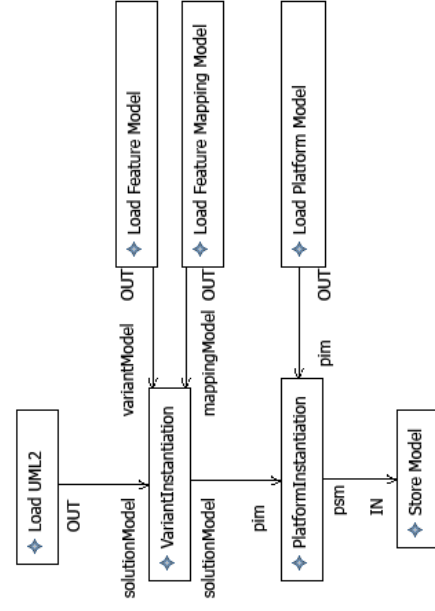

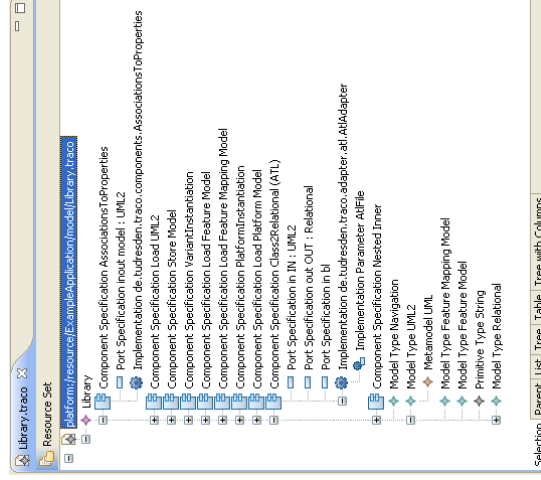

3. Validation of each transformation and composition step

- Type-checking
- Invariant- and constraint-checking
- Correctness of port and parameter binding
- Static and dynamic analysis

4. Execution of composition program

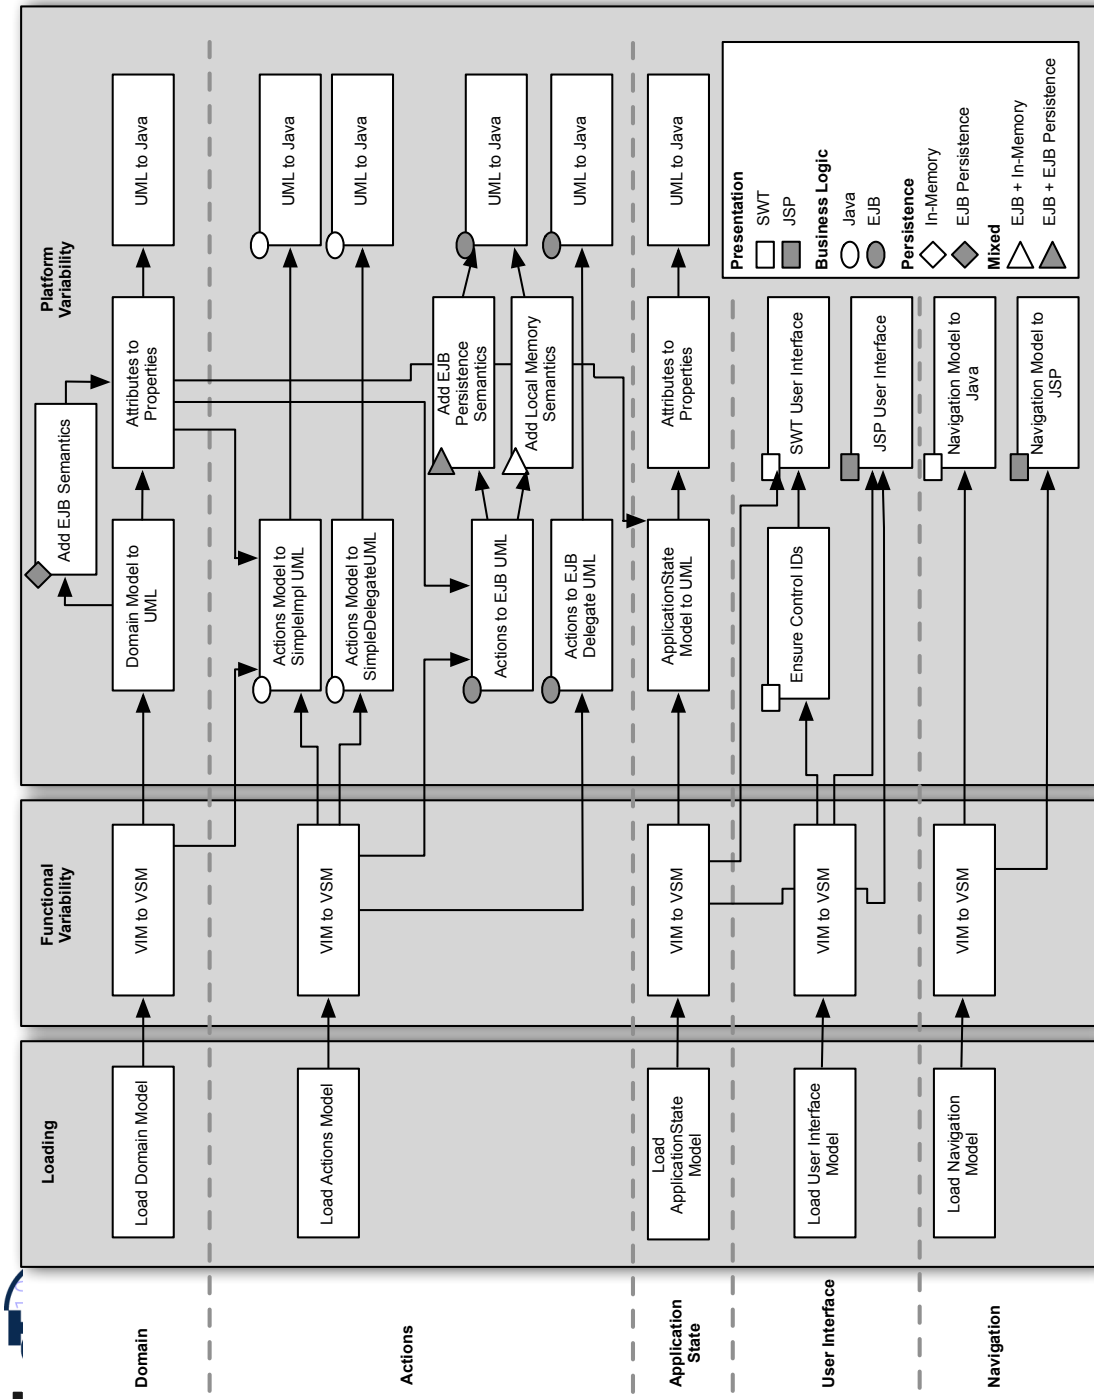

➤ Implemented in our tool TraCo

„Anything you can do, I do meta“ (Charles Simonyi)

- The composition program shown in the last slide can be subject to transformation and composition
- If we build a product line with TraCo, platform variability can be realised by different transformation steps
- A TraCo composition program can be used with FeatureMapper
 - Multi-Staged transformation steps
 - Even of composition programs
- More about *metacomposition* in CBSE course

- **Motivation: Make sure that well-formedness of all participating models is ensured**
 - Feature Model
 - Mapping Model
 - Solution Models
- **Well-formedness rules are described in the SPL**
- **Constraints are enforced during runtime**

The screenshot shows the Eclipse IDE interface. The Package Explorer on the left displays a project structure for 'ContactManagement/solution/FOSD09.featuremapping', including 'Constraint OWL', 'Feature ContactManagement', and 'Feature Group 0'. The Solution Space View in the center shows a table of feature elements:

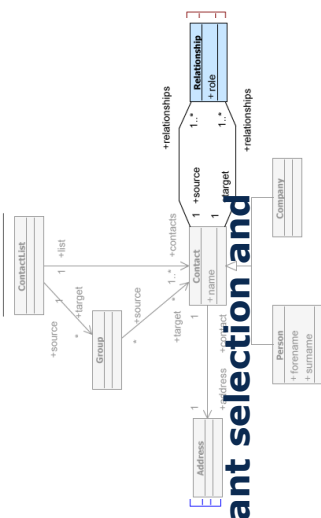

Feature	Element	Re:
Feature Flood	Feature Flood	
Feature Flood	<Property> handicap : HandicapKind [1..*]	
Feature Flood	<Association> A_<rescueMission> _<rope>	
Feature Flood	<Enumeration Literal> MENTAL	
Feature Flood	<Enumeration Literal> SURD	
Feature Flood	<Class> HandicappedVictim	

The Properties View on the right shows the 'Value' property for 'Constrained Features' set to 'Feature MultipleAssignment, Feature Highrise', and 'Expression' set to 'conflicts'. The 'Language' is 'OWL'.

Case Studies with FeatureMapper, TraCo, and FEASIPLE

- **Simple Contact Management Application Software Product Line**
 - FeatureMapper used to map features to UML2 model elements
 - Both static and dynamic modelling
- **Simple Time Sheet Application Software Product Line**
 - FeatureMapper used to tailor ISC composition programs
 - ISC used as a universal variability mechanism in SPL
 - Meta Transformation
- **SalesScenario Software Product Line**
 - FeatureMapper used to tailor models expressed in Ecore-based DSLs
 - was developed in project **feasiPLe** (<http://www.feasiple.de>)
- **TAOSD AOM Crisis Management System**

- **Configuration of product lines with mapping of feature models to solution spaces**
- **Mapping of Features to models in Ecore-based languages using FeatureMapper**
- **Visualisations of those mappings using MappingViews**
 - Realisation View
 - Variant View
 - Context View
 - Property-Changes View

➤ Derivation of solution models based on variant selection and mapping

- **Multi-Staged derivation using TraCo**
- **Ensuring well-formedness of SPLs**

<http://featuremapper.org>
