Comparison of Architectural Styles

The KWIC Problem

- ▶ "Keyword in Context" problem (KWIC) is one of the 10 model problems of architecture systems [Shaw-ModelProblems, www.cmu.edu] [Shaw/Garlan96, Pfleeger 5.7]
- > Originally proposed by Parnas to illustrate advantages of different designs [Parnas72]
- > For a text, a KWIC algorithm produces a permuted index
 - > Every sentence is replicated and permuted in its words, i.e., the words are shifted from left to right.
 - > Every first word of a permutation is entered into an alphabetical index, the permuted index.

Prof. U. Aßmann	Comparison of Architectural Styles	5	

		A KWIC Index
every sentence is replicated	and	permuted
	every	sentence is replicated and permuted
 every sentence	is	replicated and permuted
 every sentence is replicated and	permuted	
 every sentence is	replicated	and permuted
 every	sentence	is replicated and permuted

- Each line is an ordered set of words,
- and each word is an ordered set of characters.
- > Any line may be "circularly shifted" by repeatedly removing the first word and appending it at the end of the line.
- > The output of the KWIC index system is a listing of all circular shifts of all lines in alphabetical order

KWIC

Problem?

➢ Bad:

S

- > State of the repository visible to several callers
- > A change in the data affects all modules
- > High costs if algorithm have to be changed
- > The modules are not reusable
- > Bad encapsulation of module secrets!
- ➢ Good:
 - > Fast, due to shared memory access
 - Easy to code
- Shared memory is a fast concept, but provides few information hiding.

The KWIC Problem in Decentralized Memory

➤ Good:

- Data and algorithm are easier to change (e.g., packing and storing the whole character) since
 - > Data representation is hidden in functions
 - Algorithm partly hidden
 - The control flow works "on demand" from the Control through the Output backwards to the Input
- > More module secrets: char, sentence, and index representation
- Layering

Bad:

Adding new functions may be hard, since control flow intertwines the modules tightly

Comparison of Architectural Styles

14

The KWIC Problem in Implicit Invocation Style (ECA Style)

➢ Good:

Data and algorithm are easy to change

they are hidden in functions

- The control flow works forward by "implicit invocation", i.e., sending an event, from the Input/Lines through the Shifter and the Sorter
 - The listeners test conditions and execute an action
- Layering
- Event-based style simplifies the addition of new functions, since they may additionally listen to the events; event sources need not be changed (even more module secrets)

➤ Bad:

- > Flow of control is hard to predict
- > Hard to analyze statically; unusable for safety-critical systems

Easy to use	CALL-	CALL-	ECA	DATA-
Algorithm	KEP	JEC -	+	+
Data representation	-	+	-	+
Function	-	-	+	+
Good performance	+	+	-	-
Easy reuse	-	+	+	+
 [Shaw/Garlan 1996] Comp priorities. 	parison car	n be impro	oved with	weighted

The KWIC Problem in Pipe-And-Filter Data-Flow Style

Good:

- > Data and algorithm are easy to change (by filter exchange)
- Adding new functions is easy (new filters)
- Flow of control is easy to say
- \succ Data representation is completely hidden in the filters
- Highly reusable filter modules

Bad:

No evolution to interactive system
