

40. Exchange Syntax and Textual DSLs using EMFText

1

Florian Heidenreich, Jendrik Johannes, Sven Karol, Mirko Seifert, Christian Wende, Uwe Aßmann

Version 13-0-0.1, 10/22/12

- 1) What is a DSL?
- 2) How to build a DSL
 - 1) Defining/Using a meta model
 - 2) Syntax Definition
 - 1) Generating an initial syntax (HUTN)
 - 3) Refining the syntax
- 3) Advanced features
 - 1) Mapping text to data types
 - 2) Reference resolving
 - 3) Syntax modules (Import and Reuse)
 - 4) Interpretation vs. Compilation
- 4) Integrating DSLs and GPLs
- 5) Other DSL examples in the Zoo
- 6) Conclusion

EMFText is used by our new start-up, DevBoost
www.devboost.de

40.1 What is a DSL?

What's in a Domain-Specific Language (DSL)?

5

Prof. U. Armann, Softwareentwicklungswerkzeuge (SEW)

Productivity Gains with DSL

6

Prof. U. Armann, Softwareentwicklungswerkzeuge (SEW)

Figure 3: Measured productivity improvements in various domains

Juha-Pekka Tolvanen. Domain-Specific Modeling for Full Code Generation. January 2010. Vol. 12, Number 4. <http://journal.thedacs.com/issue/52/144>

What is a Textual Domain-Specific Language (DSL)?

7

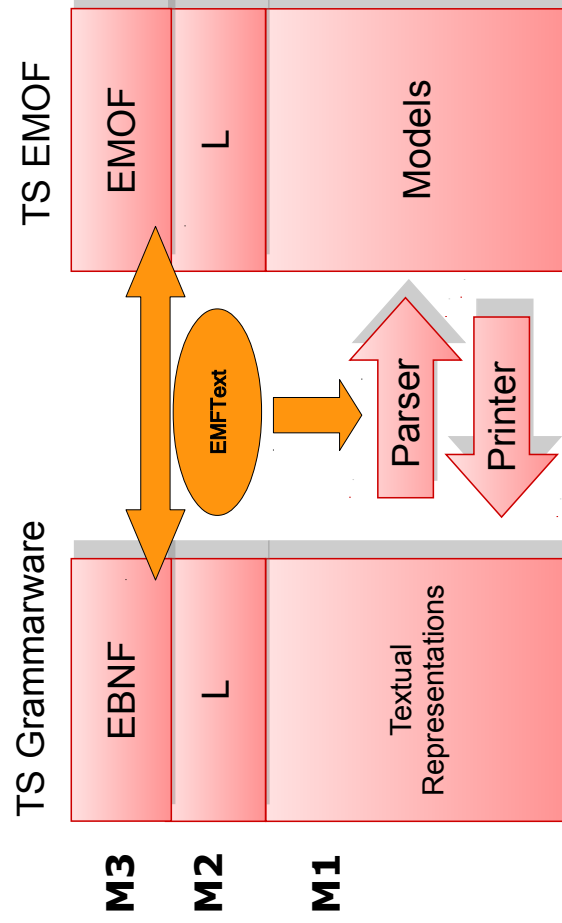

- ▶ EMFText relates a concrete syntax specification (grammar in EBNF) to a EMOF/Ecore-based metamodel.
- ▶ From this language mapping, printers, parsers and editors for a DSL can be generated

Textual DSL rely on a Transformation Bridge from EMOF to Grammarware

8

- ▶ EMFText relates a concrete syntax specification (grammar in EBNF) to a EMOF/Ecore-based metamodel.
- ▶ From this language mapping, printers (unparsers), parsers and editors are generated
- ▶ EMFText can be used to produce normative concrete syntax for exchange formats

Motivation – Why DSLs?

- + Use the concepts and idioms of a domain
- + Domain experts can understand, validate and modify DSL programs
- + Concise and self-documenting
- + Higher level of abstraction
- + Can enhance productivity, reliability, maintainability and portability
- + Embody domain knowledge, enabling the conservation and reuse of this knowledge

But:

- Costs of design, implementation and maintenance
- Costs of education for users
- Limited availability of DSLs

From: <http://homepages.cwi.nl/~arie/papers/dslbib/>

EMFText Motivation – Why Textual syntax?

Why use textual syntax for models?

- Readability
- Diff/Merge/VCS
- Evolution
- Tool autonomy
- Quick model instantiation

Why create models from text?

- Tool reuse (e.g., to perform transformations (ATL) or analysis (OCL))
- Know-how reuse
- Explicit representation of text document structure
- Tracing software artifacts
- Graphs instead of strings

Be aware: exchange syntax is like a textual DSL

Design principles:

- Convention over Configuration
- Provide defaults wherever possible
- Allow customization for all parts of a syntax

Syntax definition should be

- Simple and easy for small DSLs
- Yet powerful for complex languages

EMFText Features

▲ Generation Features

- Generation of independent code
- Generation of Default Syntax
- Customizable Code Generation

▲ Specification Features

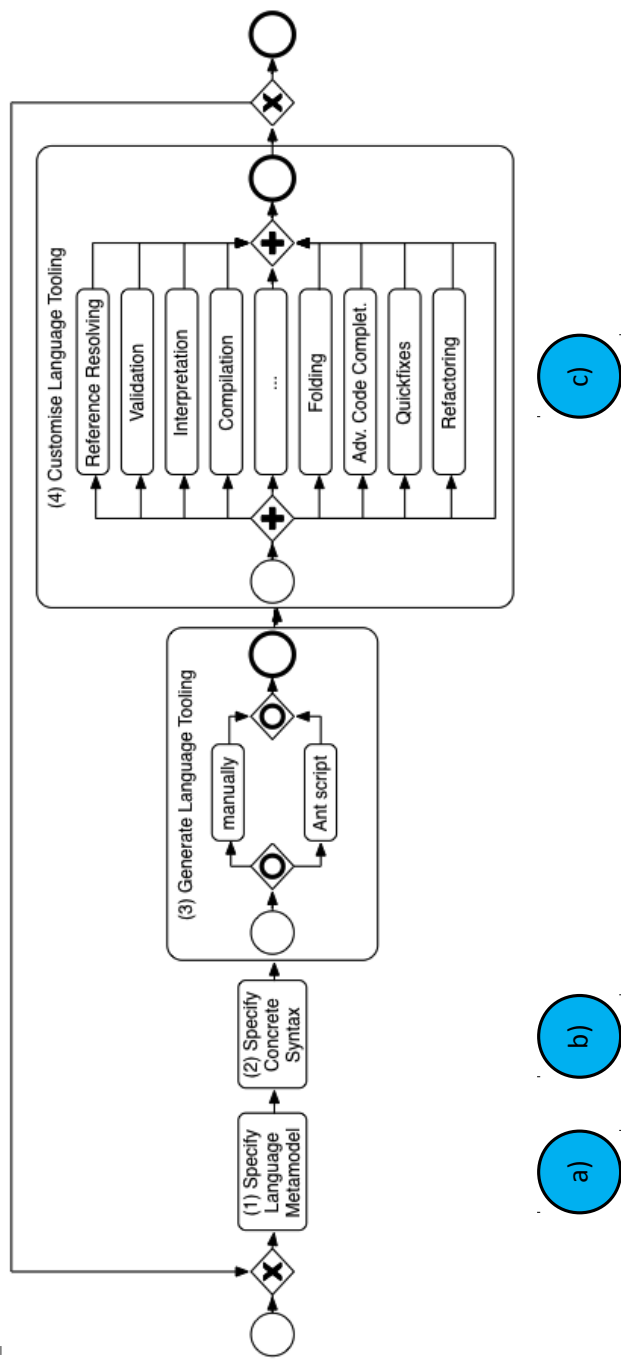

- Modular Specification
- Default Reference Resolving
- Comprehensive Syntax Analysis

▲ Editor Features

- Code Completion, Customizable Syntax and Occurrence Highlighting, Code Folding, Error Marking, Hyperlinks, Text Hovers, Outline View, ...

▲ Other Highlights

- ANT Support, Post Processors, Builder, Interpreter and Debugger Stubs, Quick Fixes

40.2 How to Build a DSL with EMFText

How to build a DSL – Metamodel

15

- Creating a new meta model:
- Define concepts, relations and properties in an Ecore model
 - Existing meta models can be imported (e.g., UML, Ecore, ...)

Prof. U. Almann, Softwareentwicklungswerkzeuge (SEW)

How to build a DSL – Metamodel

16

Metamodel elements:

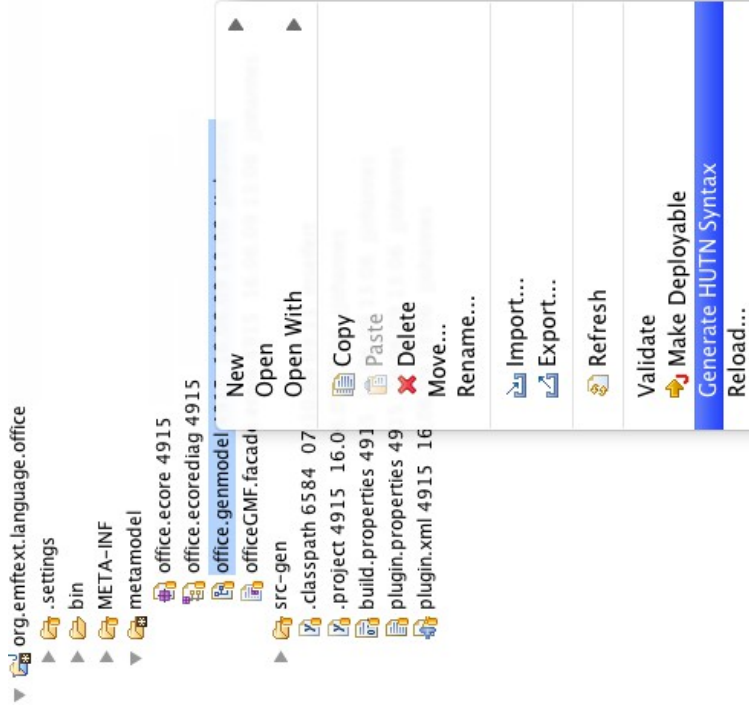

- Classes
- Data Types
- Enumerations
- Attributes
- References (Containment, Non-containment)
- Cardinalities
- Inheritance

Prof. U. Almann, Softwareentwicklungswerkzeuge (SEW)

Generate initial syntax (Human Usable Text Notation)

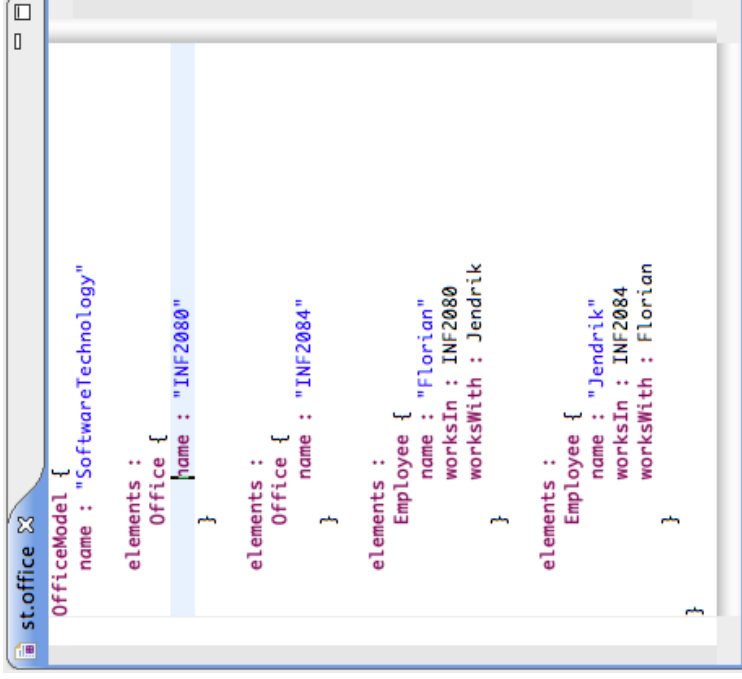

17

Initial HUTN Syntax - Grammar

18

st.office

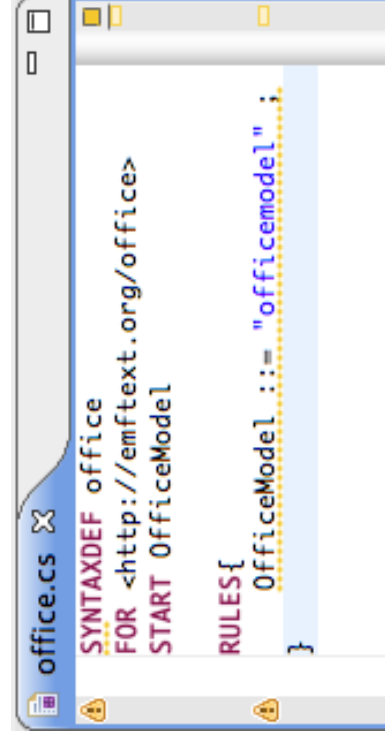

```
OfficeModel {
  name : "SoftwareTechnology"
}
elements :
  Office {
    name : "INF2080"
  }
elements :
  Office {
    name : "INF2084"
  }
elements :
  Employee {
    name : "Florian"
    worksIn : INF2080
    worksWith : Jendrik
  }
elements :
  Employee {
    name : "Jendrik"
    worksIn : INF2084
    worksWith : Florian
  }
}
```

b)

Syntax Refinement – The Concrete Syntax Language

Structure of a .cs file:

- Header
 - File extension
 - Meta model namespace URI, location
 - Start element(s)
 - Imports (meta models, other syntax definitions)
- Options
- Token Definitions
- Syntax Rules

office.cs

```
SYNTAXDEF office
FOR <http://emftext.org/office>
START OfficeModel

RULES{
  OfficeModel ::= "officemodel";
}
```

office : http://emftext.org/office

- [ab] TEXT
- [ab] WHITESPACE
- [ab] LINEBREAK
- abc officemodel
 - OfficeModel
 - alb Choice

b)

Syntax Refinement – Syntax Rules in EBNF

21

▶ One syntax rule per meta class defines the *language mapping* between EBNF and EMF metaclasses

- Syntax: `MetaClassName ::= Syntax Definition ;`

▶ All concept mappings define a *language mapping*

▶ Definition elements in EBNF rules:

- Static strings (keywords) "public"
- Choices a|b
- Multiplicities +,*
- Compounds (ab)
- Terminals a[] (Non-containment references, attributes)
- Non-terminals a (Containment references)

Customized Syntax Rules - Examples

22

OfficeModel ::= "officemodel" name[]
 "{ elements* }";

```
officemodel SoftwareTechnology {  
    ...  
}
```

```
OfficeModel ::= "officemodel" name[]
              "{" elements* "}" ;
```

```
Employee ::= "employee" name[]
            "works" "in" worksIn[]
            "works" "with" worksWith[]
            ( "," worksWith[] ) * ;
```

```
Office ::= "office" name[] ;
```

```
officemodel SoftwareTechnology {
  office INF2080
  employee Florian
  works in INF2080
}
```

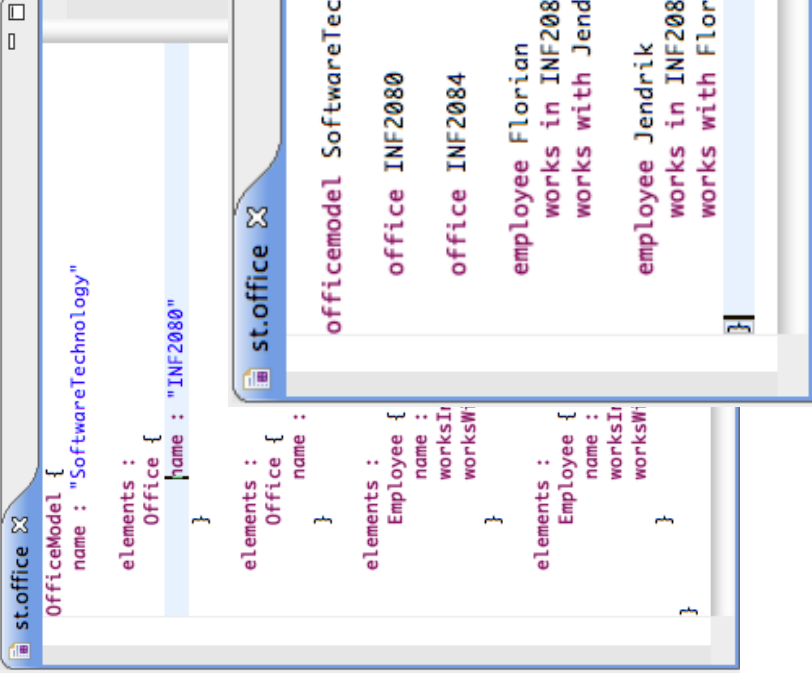

b)

Grammar of Complete Customized Syntax

```

office.cs
SYNTAXDEF office
FOR <http://emftext.org/office>
START OfficeModel
OPTIONS {
  generateCodeFromGeneratorModel = "true";
}
RULES {
  OfficeModel ::= "officemodel" name[]
                "{" elements* "}" ;
  Office ::= "office" name[] ;
  Employee ::= "employee" name[]
              "works" "in" worksIn[]
              "works" "with"
              worksWith ( "," worksWith[] ) * ;
}
  
```

b)

b)

40.3. Advanced Features of EMFText

Advanced Features – Attribute Mapping

27

- ▶ Putting strings into EString attributes is easy
- ▶ How about EInt, EBoolean, EFloat, ..., custom data types?
- ▶ Solution A: Default mappingThe generated classes use the conversion methods provided by Java (java.lang.Integer, Float etc.)
- ▶ Solution B: Customize the mapping using a token resolver

```
public void resolve(String lexem, EStructuralFeature feature,
    ITokenResolveResult result) {
    if ("yes".equals(lexem)) result.setResolvedToken(Boolean.TRUE);
    else result.setResolvedToken(Boolean.FALSE);
}

public String deResolve(Object value, EStructuralFeature feature,
    EObject container) {
    if (value == Boolean.TRUE) return "yes"; else return "no";
}
```

Prof. U. Almann, Softwareentwicklungswerkzeuge (SEW)

Advanced Features – Resolving Cross References

28

- ▶ Well, quite similar to attribute mappings:
- ▶ Solution A: Default resolvingSearches for matching elements that have an ID attribute, a name attribute or a single attribute of type EString and picks the first(Works well for simple DSLs without scoping rules)
- ▶ Solution B: Custom resolvingChange the generated resolver class (implements IReferenceResolver<ContainerType, ReferenceType>)For examples see the resolvers for the Java language

Prof. U. Almann, Softwareentwicklungswerkzeuge (SEW)

```
java_template.cs
SYNTAXDEF Java Template
FOR <http://www.emftext.org/language/java_templates>
START JavaTemplate
IMPORTS {
  Java : <http://www.emftext.org/java> <.../..../org.emftext..language..java..metamodel1/java..genmodel1>
  WITH SYNTAX java <.../..../org.emftext..language..java..metamodel1/java..cs>
}
OPTIONS {
  usePredefinedTokens = "false";
  overrideManifest = "false";
}
```

c)

- ▶ Import meta models optionally with syntax
- ▶ Extend, Combine existing DSLs
- ▶ Create embedded DSLs (e.g., for Java)
- ▶ Create a template language from your DSL
- ▶ ...

Disclaimer: Pitfalls of Language Integration (with EMFText)

Syntax and model extensions can be non-trivial

In EMFText problems may be caused by

- Unexpected inclusions between token definitions
- Intersections between token definitions (partial overlaps)
- Problems with the underlying parser generator, e.g. left-recursion or extensive backtracking
- Ambiguous grammars (may require non monotonic changes to the grammar and the metamodels)
- Interference between reference resolvers
- Different language semantics

Alternative parsing technologies: Scannerless Parsing, Context-Aware Scanning, SDF/SGLR, MPS, Packrat Parsing, Parsing Expression Grammars

Using the DSL – Interpretation vs. Compilation

31

So far we achieved to

- map input documents (text) to models
- do the inverse
-

EMFText provides an extension point to perform interpretation (or compilation) whenever DSL documents change

To use the DSL we need to assign meaning by

- ▲ Interpretation Traverse the DSL document and perform appropriate actions
- ▲ Compilation Translate the DSL constructs to another (possibly executable) language
- ▲ (In principle compilation is an interpretation where the appropriate action is to emit code of the target language)

Challenges for Model-Driven Software Development (MDSD)

32

- ▲ Developers are required to use different tool machinery for DSLs and General Purpose Programming Languages (GPL)
- ▲ Explicit references between DSL and GPL code are not supported. Their relations are, thus, hard to track and may become inconsistent
- ▲ DSLs can not reuse (parts of) the expressiveness of GPLs
- ▲ Naive embeddings of DSL code (e.g., in Strings) do not provide means for syntactic and semantic checking
- ▲ Interpreted DSL code is hard to debug
- ▲ Generated GPL code is hard to read, debug and maintain

Using the DSL – Interpretation vs. Compilation

33

- ▲ Create an interpreter/compiler in Java
 - Initially easy, but hard to maintain
-
- ▲ Use a model transformation
 - ATL, Epsilon, ...
- ▲
- ▲ Use a template engine
 - DSL documents are the parameter (models)

Prof. U. Almann, Softwareentwicklungswerkzeuge (SEW)

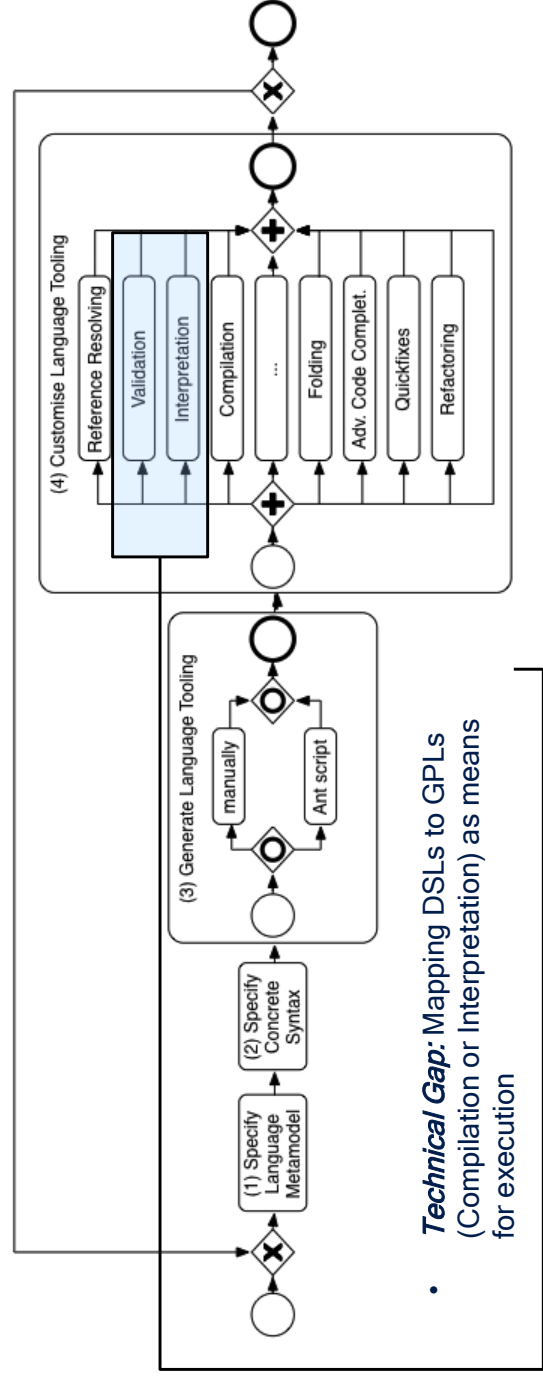

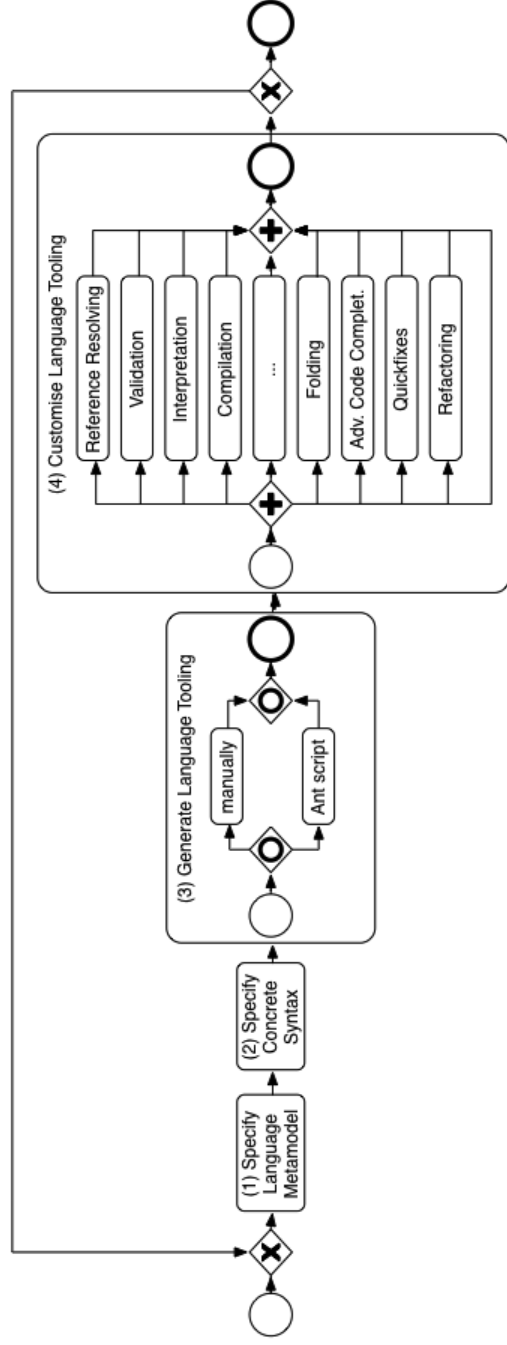

40.4. Integrating DSLs and GPLs

34

Softwareentwicklungswerkzeuge (SEW) © Prof. Uwe Almann

40.4.1 Integrating DSLs and GPLs - Approach

37

- (1) Use EMFText to *lift* GPLs to the technical space of DSLs
- (2) Language integration by metamodel and grammar inheritance

JaMoPP: Lifting Java to TS of DSLs

38

- ▶ Ingredients:
 - Ecore Metamodel for Java 5 (153 concrete, 80 abstract classes)

JaMoPP Metamodel

JaMoPP: Lifting Java to TS of DSLs

39

Ingredients:

- Ecore Metamodel for Java 5 (153 concrete, 80 abstract classes)
- EMFText .cs definition for each concrete class

40

JaMoPP: Lifting Java to TS of DSLs

Ingredients:

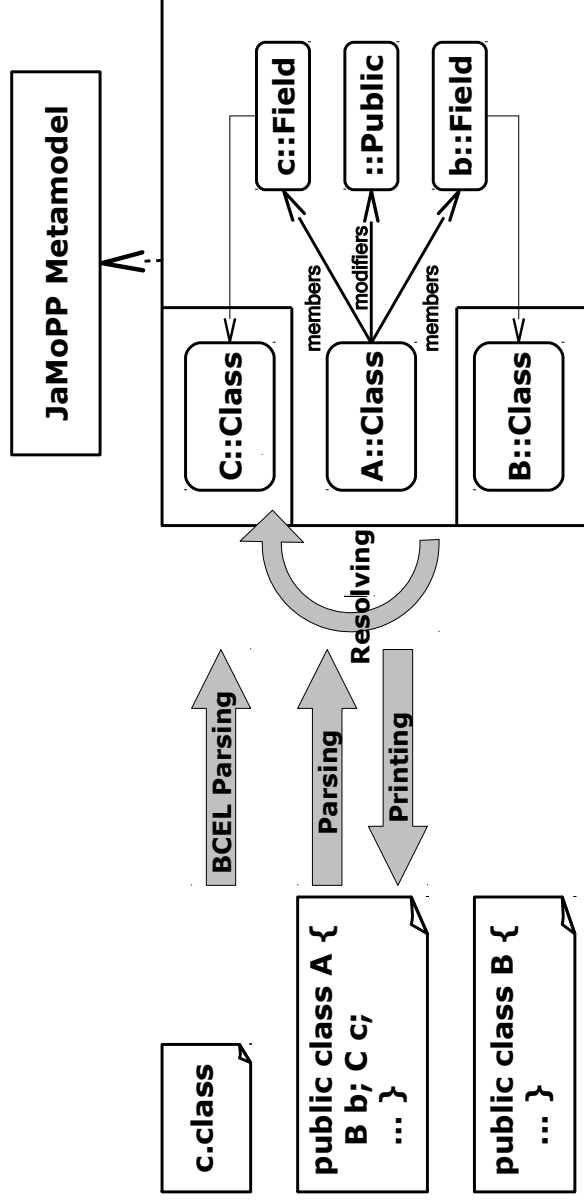

- Ecore Metamodel for Java 5 (153 concrete, 80 abstract classes)
- EMFText .cs definition for each concrete class
- BCEL Bytecode-Parser – to handle third-party libraries

JaMoPP: Lifting Java to TS of DSLs

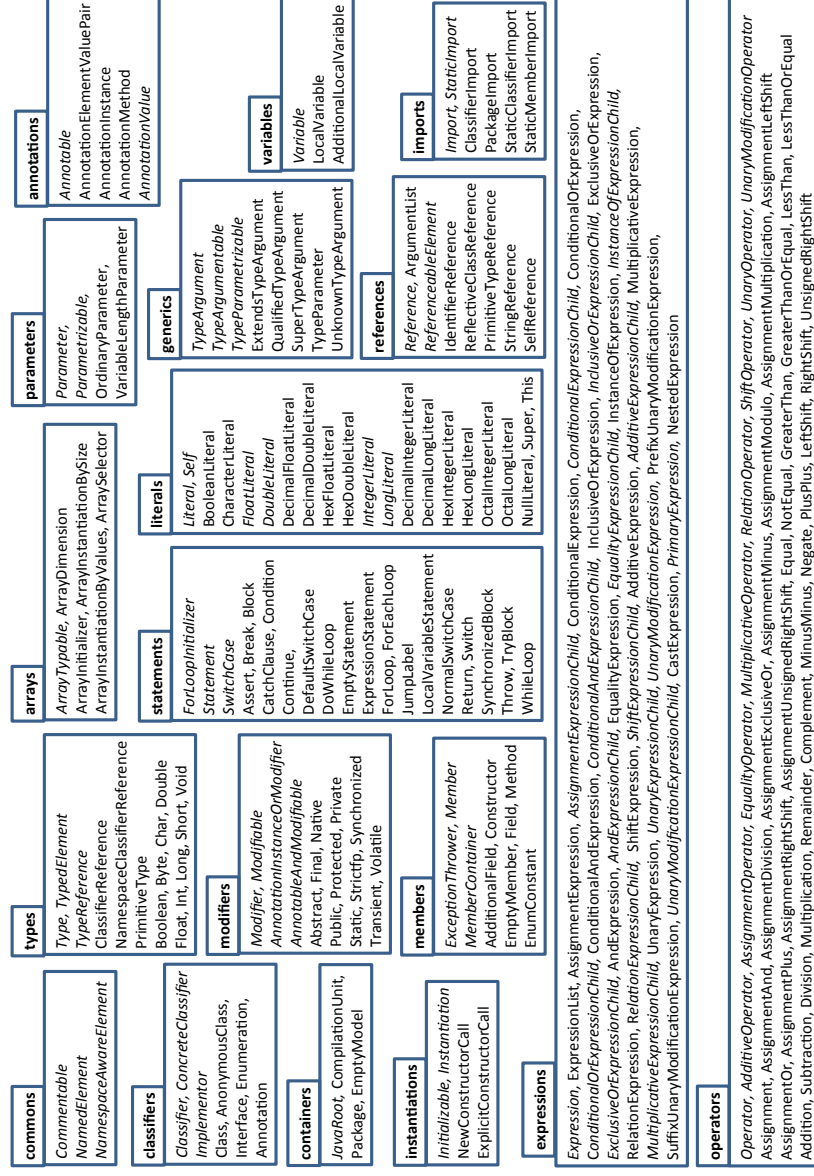

41

- Ingredients:
- Ecore Metamodel for Java 5 (153 concrete, 80 abstract classes)
- EMFText .cs definition for each concrete class
- BCEL Bytecode-Parser – to handle third-party libraries
- Reference Resolvers that implement java-specific scoping (static semantics)

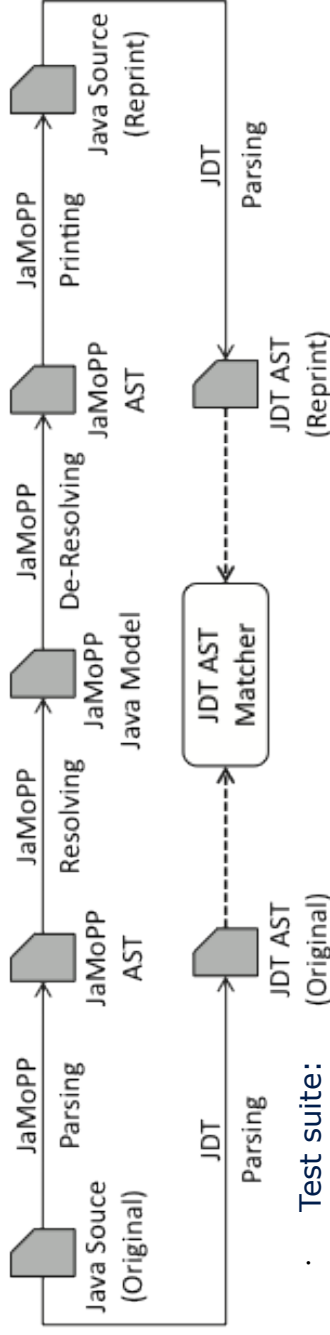

JaMoPP Metamodel

42

- Parsing public class A is easy, but parsing Java 5 is not (Unicode, Generics, Annotations and lots of weird things allowed by the JLS)
- We wanted JaMoPP to be complete

- Test suite:
 - 88.595 Java files (14.7 million non-empty lines including comments)
 - Open Source projects:
 - AndromDA 3.3, Apache Commons Math 1.2, Apache Struts 2.1.6, Apache Tomcat 6.0.18, Eclipse 3.4.1, Google Web Toolkit 1.5.3, JBoss 5.0.0 GA, Mantissa 7.2, Netbeans 6.5, Spring 3.0.0M1, Sun JDK 1.6.0 Update 7, XercesJ 2.9.1

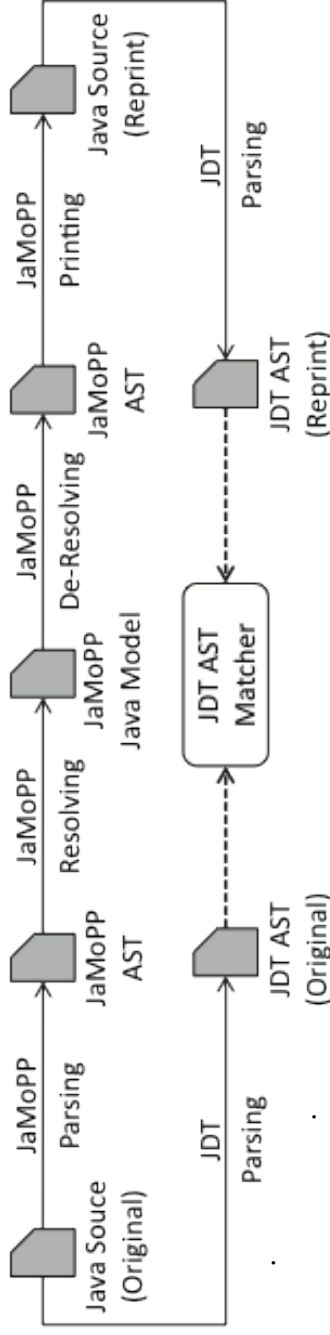

- ▶ Parsing "public class A {...}" is easy, but parsing Java 5 is not (Unicode, Generics, Annotations and lots of weird things allowed by the JLS)
- ▶ We wanted JaMoPP to be complete

- ▶ Test suite:
 - 88.595 Java files (14.7 million non-empty lines including comments)
 - Open Source projects:
 - AndromDA 3.3, Apache Commons Math 1.2, Apache Struts 2.1.6, Apache Tomcat 6.0.18, Eclipse 3.4.1, Google Web Toolkit 1.5.3, JBoss 5.0.0 GA, Mantissa 7.2, Netbeans 6.5, Spring 3.0.0M1, Sun JDK 1.6.0 Update 7, XercesJ 2.9.1

- ▶ Parsing “public class A {...}” is easy, but parsing Java 5 is not (Unicode, Generics, Annotations and lots of weird things allowed by the JLS)
- ▶ We wanted JaMoPP to be complete

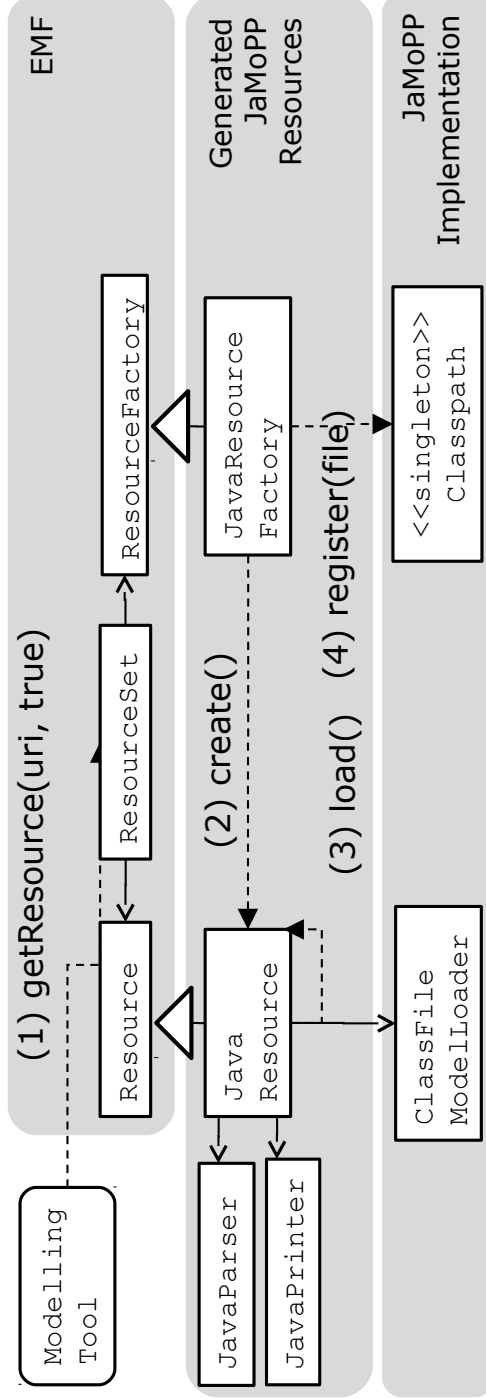

▶ Test suite:

- 88.595 Java files (14.7 million non-empty lines including comments)
- Open Source projects:
 - AndroidMA 3.3, Apache Commons Math 1.2, Apache Struts 2.1.6, Apache Tomcat 6.0.18, Eclipse 3.4.1, Google Web Toolkit 1.5.3, JBoss 5.0.0 GA, Mantis 7.2, Netbeans 6.5, Spring 3.0.0M1, Sun JDK 1.6.0 Update 7, XercesJ 2.9.1

JaMoPP Tool Integration

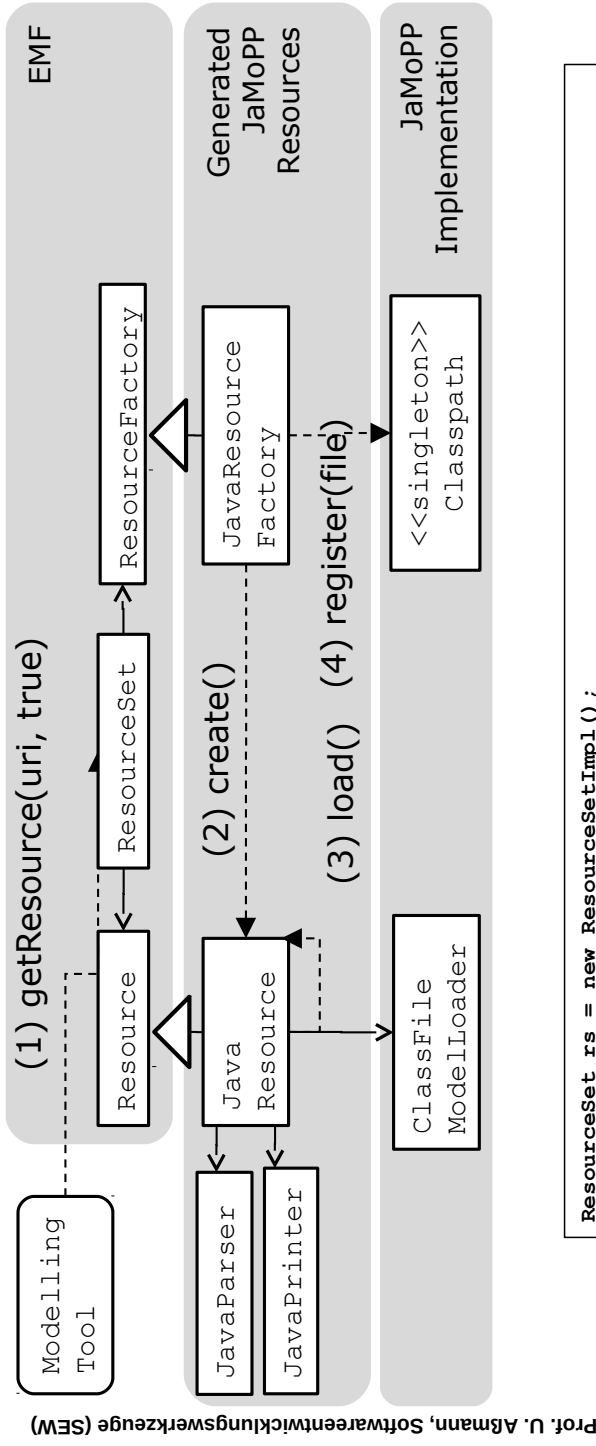

- ▶ JaMoPP seamlessly and transparently integrates with arbitrary EMF-based Tools
- ▶ Parsing Java files to models and Printing Java Files is simple

JaMoPP Tool Integration

- ▶ JaMoPP seamlessly and transparently integrates with arbitrary EMF-based Tools
- ▶ Parsing Java files to models and Printing Java Files is simple

47

Prof. U. Almamm, Softwareentwicklungswerkzeuge (SEW)

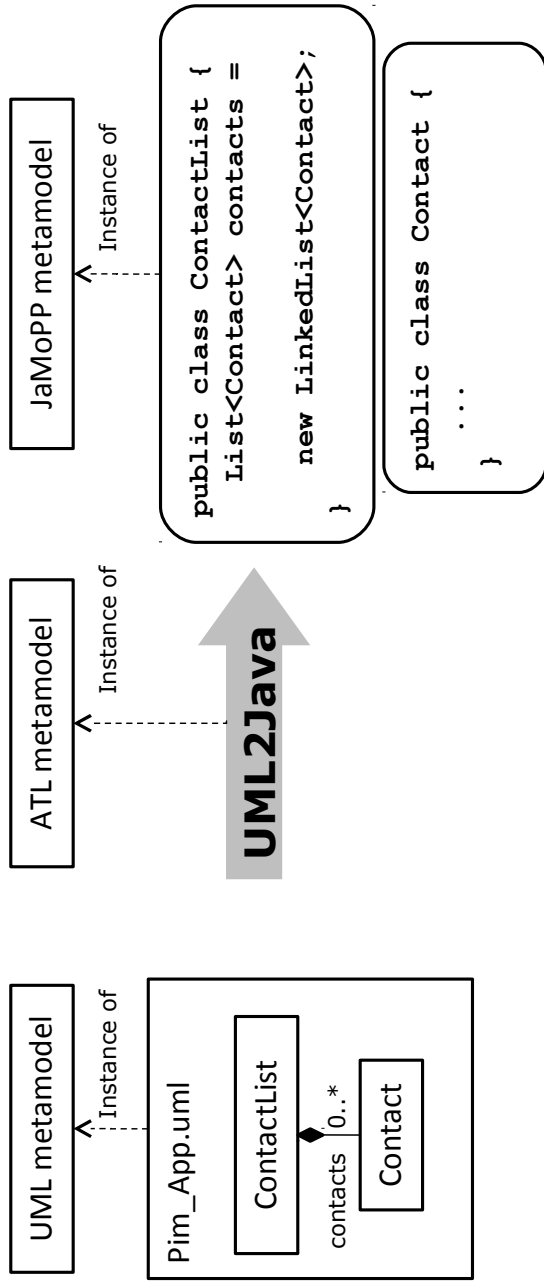

```
ResourceSet rs = new ResourceSetImpl();
Resource javaResource = rs.getResource(URI.createFileURI("\\A.java"), true); //parsing
javaResource.save(); // printing
```

JaMoPP Application: Code Generation (ATL)

- Design UML model, apply M2M transformation, print JaMoPP model
- Syntactic and semantic correctness

48

Prof. U. Almamm, Softwareentwicklungswerkzeuge (SEW)

- ▶ Design UML model, apply M2M transformation, print JaMoPP model

```
rule Property {
  from umlProperty : uml!Property
  to javaField : java!Field {
    name <- umlProperty.name,
    type <- typeReference
  },
  typeReference : java!TypeReference {
    target <- if (umlProperty.upper = 1) then umlProperty.type
    else
      java!Package.allInstances()->any(p | p.name = 'java.lang').compilationUnits->collect (
        cu | cu.classifiers)->flatten()->any(c | c.name = 'LinkedList')
    endif,
    typeArguments <- if (umlProperty.upper = 1) then
      Sequence{} -- empty type argument list
    else
      Sequence{typeArgument}
    endif
  },
  typeArgument : java!QualifiedTypeArgument {
    target <- umlProperty.type
  }
}
```

JaMoPP Application: Code Analysis (OCL)

- ▶ Parse Java source files to model instances
- ▶ Run OCL queries to find undesired patterns

```
context members::Field inv:
  self->modifiers->select(m|m.oclIsKindOf(modifiers::Public))->size() = 0
```

JaMoPP Application: Code Analysis (OCL)

51

The screenshot shows an IDE window titled 'ContactList.java' with the following code:

```
1 package de.tudresden.contact_management;  
2  
3 class ContactList {  
4     protected java.util.LinkedList<Group> groups;  
5  
6     public Object manuallyAddedField;  
7     Parse Java source files to model instances  
8     public void synchroniseContacts() {  
9         Run OCL queries to find undesired patterns  
10    }  
11 }
```

The Problems window shows two errors:

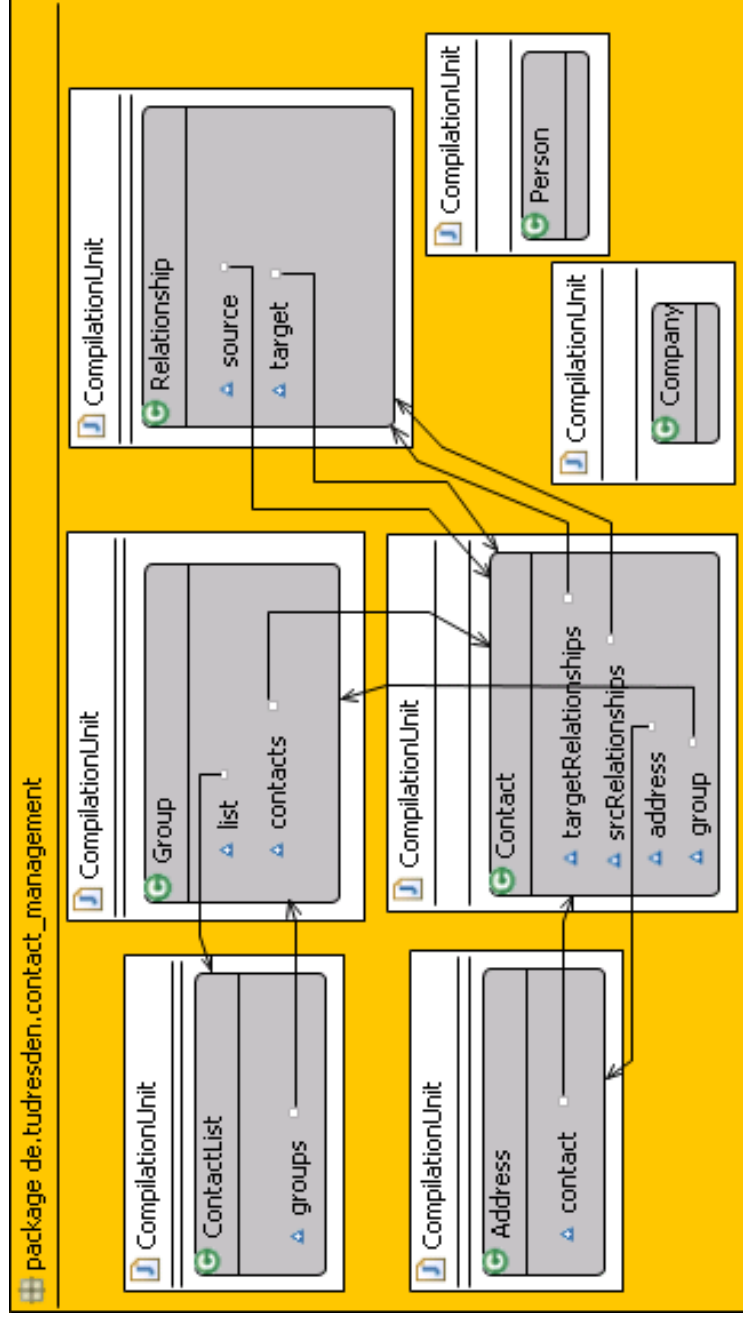

Description	Resource	Type	Location
Public fields are not allowed.	ContactList.java	EMF Text Edit Problem	line 6
Please implement empty method.	ContactList.java	EMF Text Edit Problem	line 8

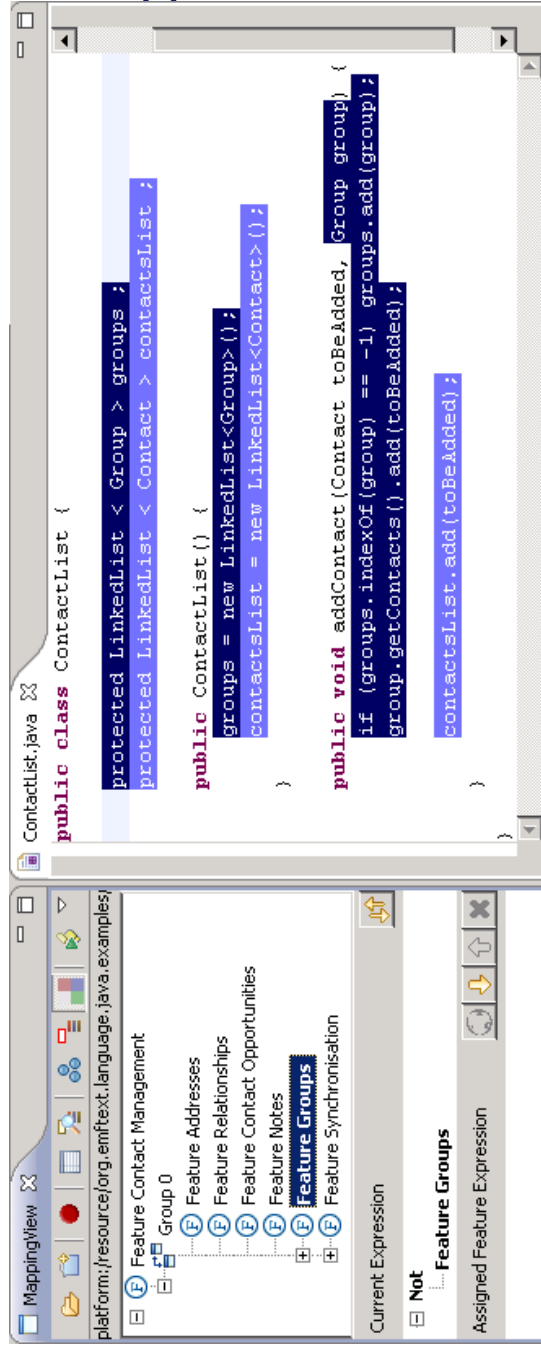

JaMoPP Application: Code Visualization (GMF)

52

- ▶ Create .gmfgraph, gmftool, and gmmap model
- ▶ Generate Graphical Editor for Java

JaMoPP Applications: What else?

- ▶ Typesafe Template Languages
 - Same syntax as string-based templates
- ▶ Round-trip Support for template-based code generators
- ▶ Refactoring, Optimization using model transformations
- ▶ Traceability-related activities
 - Certification (Map code to the model elements)
 - Impact analysis (How much of the code will change if I do this?)
- ▶ Model-based compilation to byte code
- ▶ ...

40.4.2 Integrating DSLs and GPLs

55

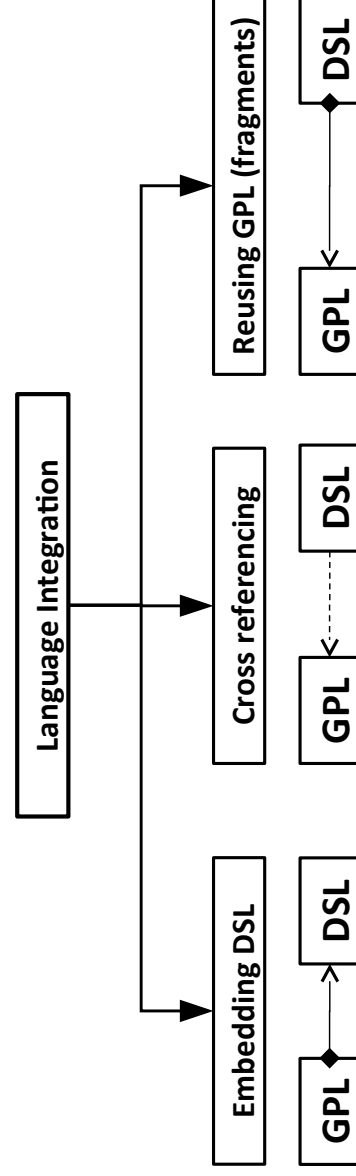

Approach

- (1) Use EMFText to *lift* GPLs to the technical space of DSLs
- (2) **Language integration by metamodel and grammar inheritance**

Integrating DSLs and GPLs

56

- ▶ Different integration scenarios

Language Integration Examples

57

- FormsExtension
- FormsEmbedded
- JavaForms

▶ eJava

- Provides metamodels with Eoperations
- implementations without touching the generated java files

▶ JavaTemplate

- Syntax safe templates with JaMoPP

▶ PropertiesJava

- Experimental extension for Java to define C# like properties

▶ JavaBehaviour4UML

- An integration of JaMoPP and the UML
- Methods can be directly added to Classes in class diagrams

40.5. The EMFText Syntax Zoo (>90 residents)

58

- ▶ Ecore, KM3 (Kernel Meta Meta Model)
- ▶ Quick UML, UML Statemachines
- ▶ Java 5 (complete), C# (in progress)

- ▶ Feature Models
- ▶ Regular Expressions
- ▶ OWL2 Manchester Syntax
- ▶ Java Behavior4UML
- ▶ DOT (Graphviz language)

...and lots of example DSLs

<http://emftext.org/zoo>

Conclusion

- Few concepts to learn before using EMFText
- Creating textual syntax for new languages is easy, for existing ones it is harder, but possible (we did Java)
- Rich tooling can be generated from a syntax definition
- Textual and graphical syntax can complement each other (e.g., to support version control)
- Semantics (Interpretation/Compilation) must be defined manually – At most it can be reused

*Language is the blood of the soul into which thoughts run
and out of which they grow.*

(Oliver Wendell Holmes)

Thank you!
