Version 1.0 [Quellen] Build 2008/12/16 (based on Fujaba 5.0.0)

43.3.1. MOFLON Einführung

- MOFLON ist ein Metamodellierungswerkzeug der TU Darmstadt, Fachgruppe Echtzeitsysteme, Prof. Andy Schürr
 - MOFLON nutzt Logik (OCL) zum Checking von Wohligformtheitsbedingungen über Modellen (AC-Werkzeug)
 - MOFLON ist eine Fujaba-Erweiterung und bietet daher Graphersetzungssysteme an www.fujaba.de (M-Werkzeug)
 - MOFLON unterstützt Triple Graph Grammars (TGG, siehe ST-II)
- MOFLON unterstützt
 - MOF 2.0
 - OCL 2.0
 - JMI 1.4
 - XML 2.1

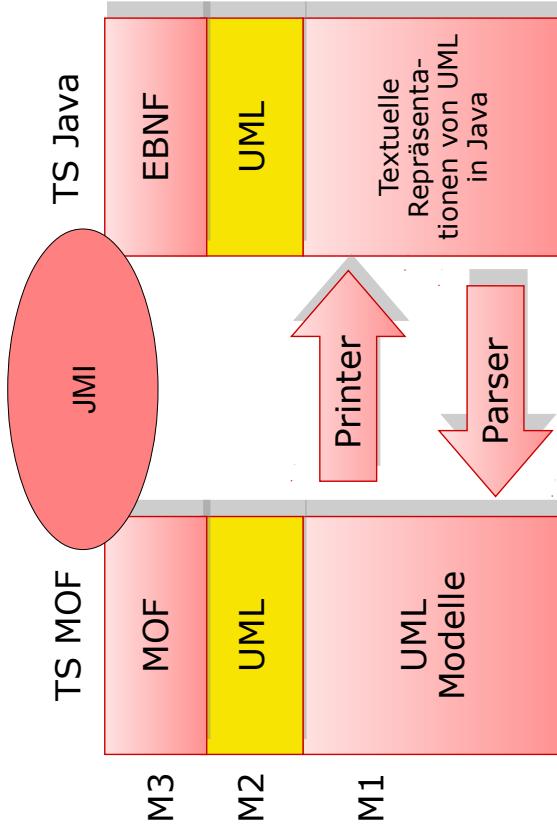

MOF
Meta-Object Facility

FUJABA
Tool Suite
Prof. U. Aßmann, SEW
3

Codegenerierung mit JMI, einer transformative TS-Brücke für MOF und Java, Sprache UML

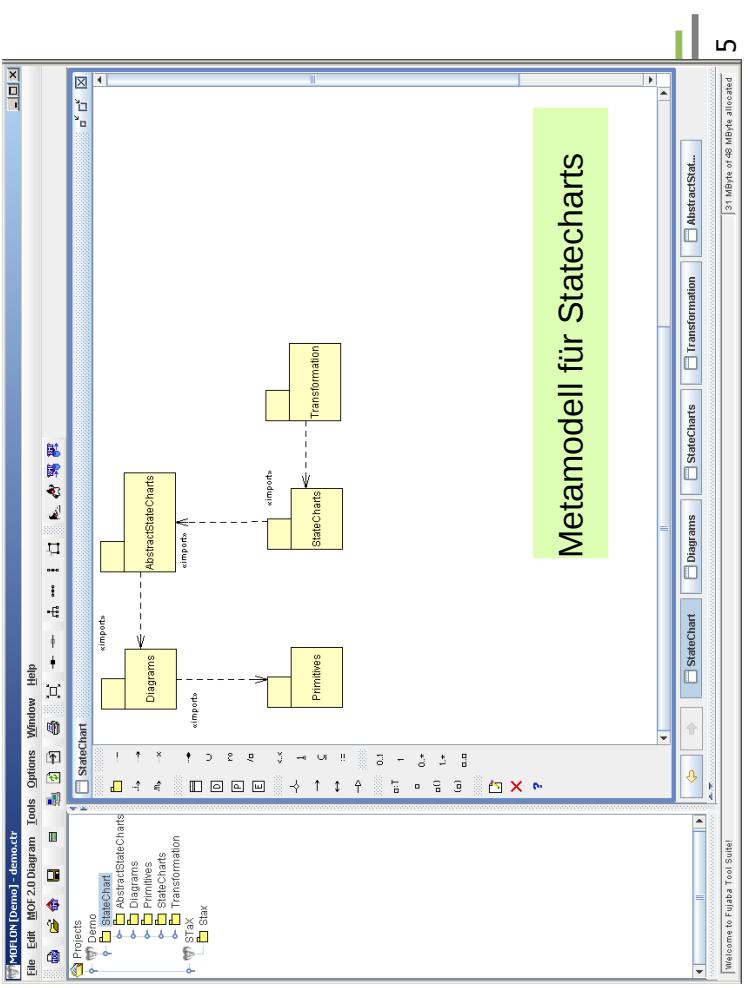

- Ähnlich zu XML, Java Metadata Interchange (JMI) ist eine TS-Halb-Brücke für MOF und EBNF-Space, für die Sprache UML

MOFLON Beispiele

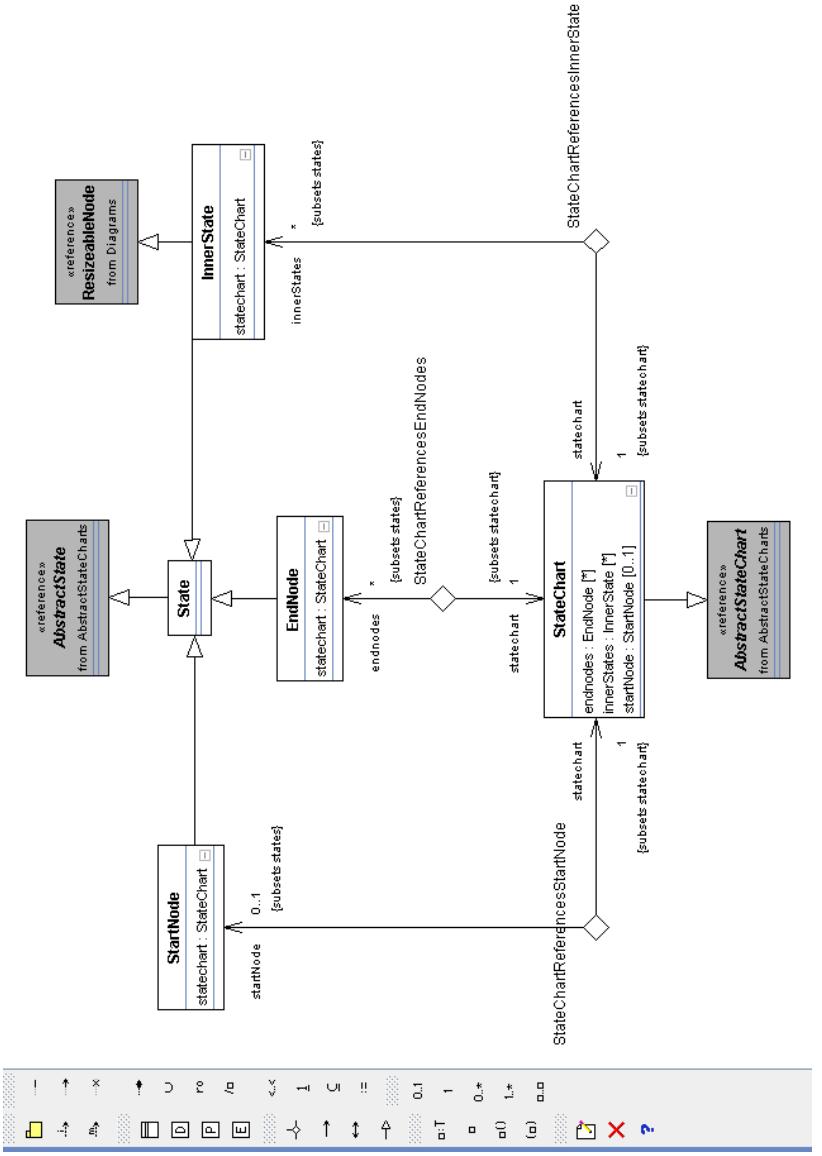

I für Statecharts:

- 1) Metamodell erstellen
 - 2) Code generieren (Repository, Constraint-checker)
 - 3) Code über JMI-Schnittstellen verwenden

Beispiel: 1.a) E für Statecharts

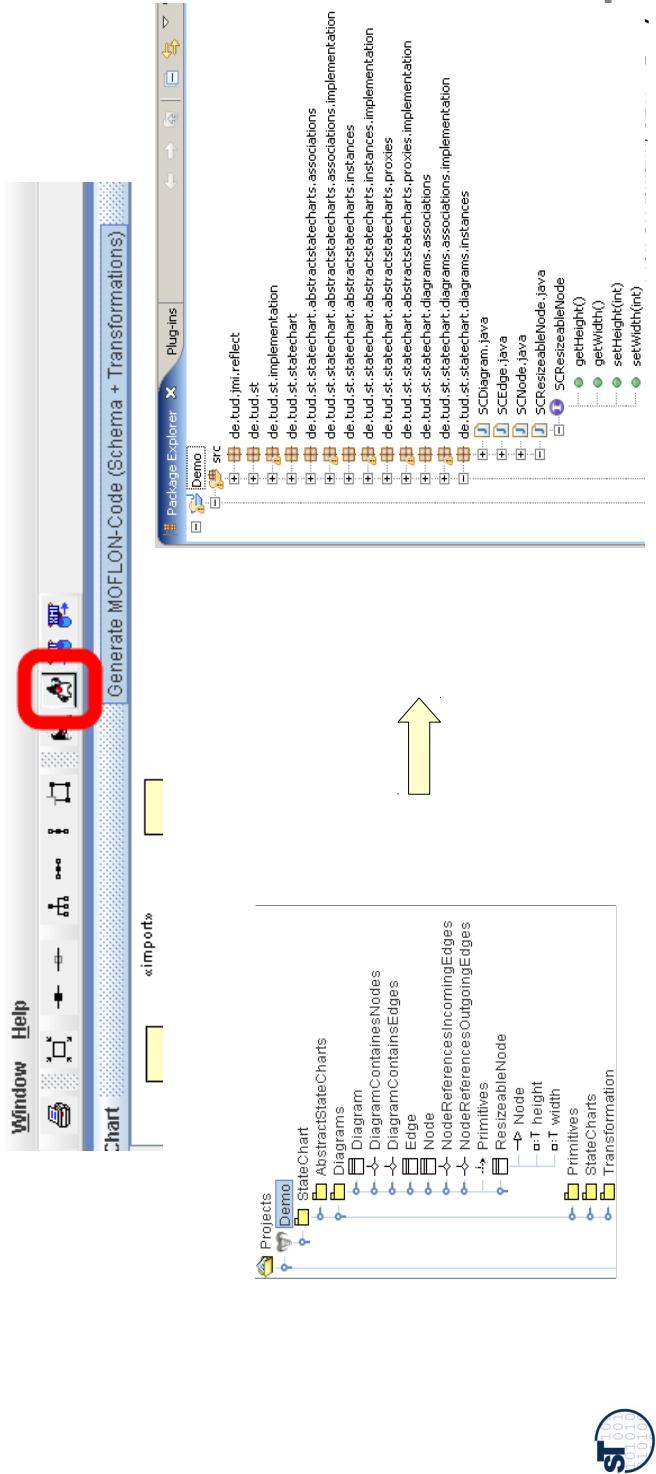

Erstellung eines MOF-Metamodells

Beispiel: 1.b) Code Statechart-Modelle

Erstellung aus Metamodell für

- ▶ Erzeugt JMI-Schnittstellen zum Metamodell (metamodellgesteuertes Repotorium)
 - ▶ Generiert Code für alle als Story-Diagramm (Fujaba) modellierten Methoden
 - ▶ Codegenerator verwendet Velocity und XSLT 1.1

Beispiel: 1.b) Codegenerierung aus Metamodell für Statechart-Modelle

Code generieren

Pro Package

- Java Paket
 - Schnittstelle
 - Implementierung
 - de.tud.st.statechart
 - SCStateChartPackage.java
 - SCStateChartPark.java

Pro Klasse

- Schnittstelle
 - Implementierung
 - Proxy Schnittstelle
 - Proxy Implementierung

Pro Assoziation

- Schnittstelle
 - SCDiagramContainsEdges.java
 - Implementierung
 - SCDiagramContainsEdgesImpl.java

Beispiel: 1.c) Codeverwendung von Statechart-Modellen

- Wurzelpaket instanzieren

```
scsstateChartPackage root = new SCSStateChartPackageImpl() ;
```

- Proxy anfordern

```
root.getSCDiagramsPackage() .getSCNode() ;
```

- Über den Proxy Instanzen des Modells erzeugen

```
SCNode node = root.getSCDiagramsPackage() .getSCNode() .createSCNode() ;
```

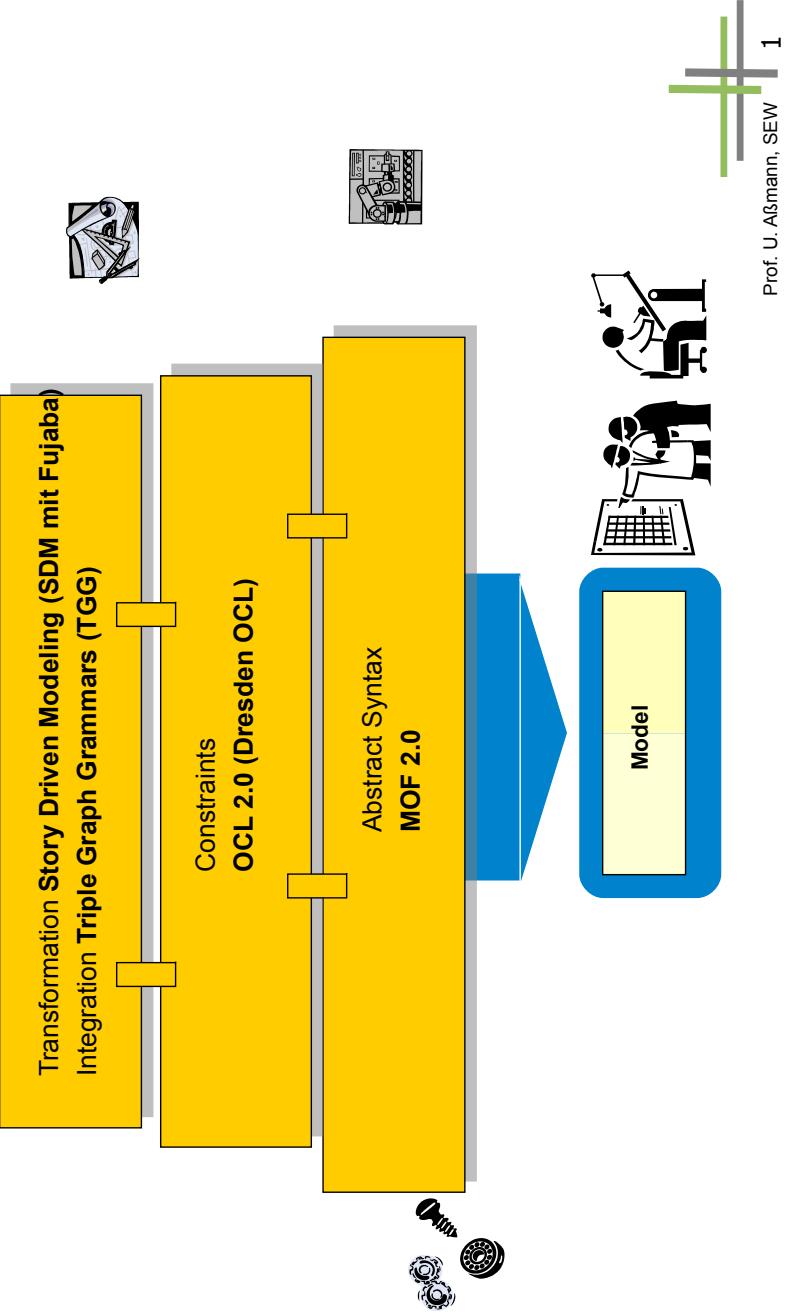

43.3.2. The Metamodeling Architecture of MetaCASE Tool MOFLON

Slides from: 10 Jahre Dresden-OCL – Workshop
<http://dresden-ocl.sourceforge.net/>
<http://dresden-ocl.sourceforge.net/10years.html>
used by permission

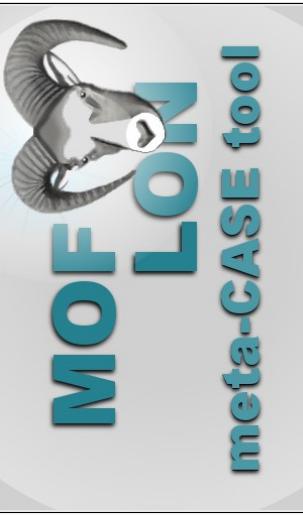

Metamodel Architecture of MOFLON

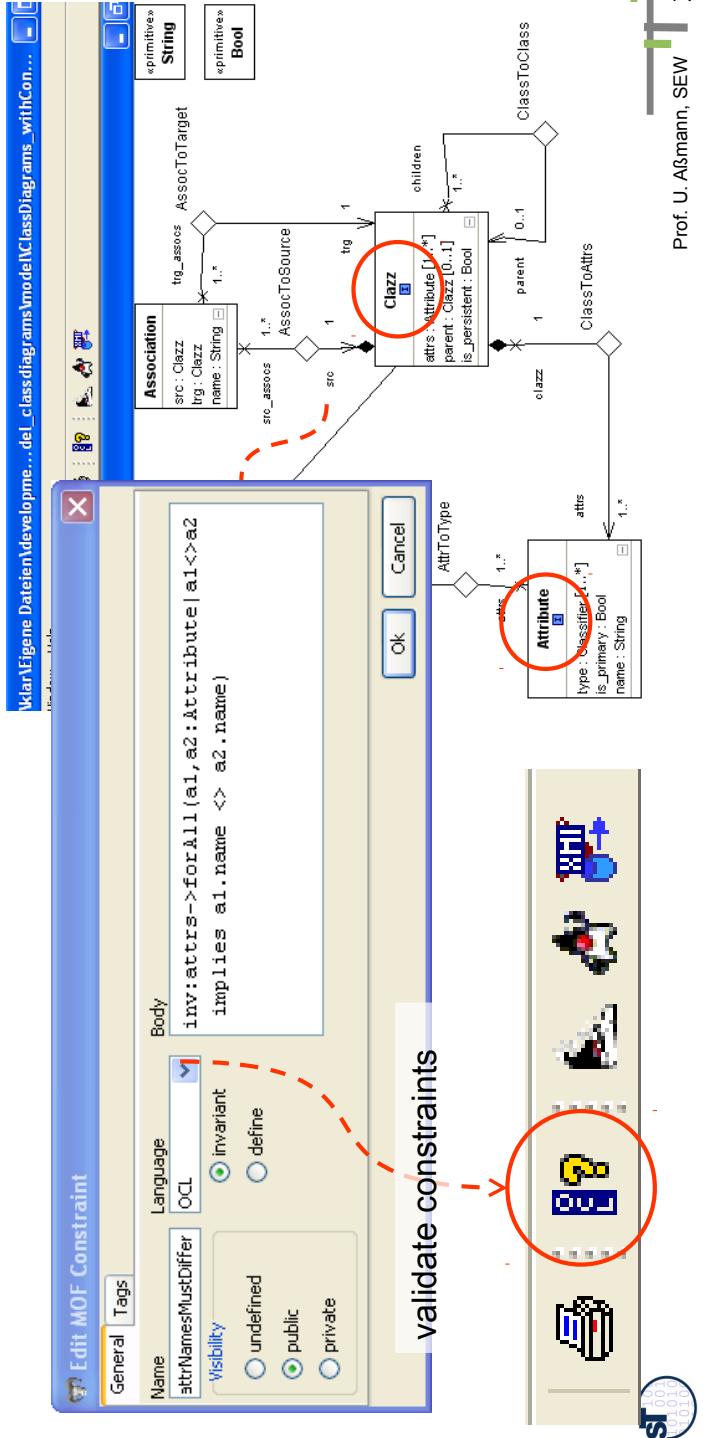

MOFLON MetaCASE – Main Features

- ▶ MOF2.0 editor (draw metamodels that comply to MOF2.0 standard)
 - ▶ build Domain Specific Languages (DSLs)
 - based on the CASE-tool framework Fujaba
 - possibility to extend MOFLON by own plugins
 - ▶ interoperability (import / export)
 - ▶ transform metamodel instances with model transformations (SDM, TGG)
 - ▶ generate code (JMI-compliant) from DSLs
 - ▶ instantiate models of the DSL (= repositories)
 - ▶ basic editing support for generated repositories

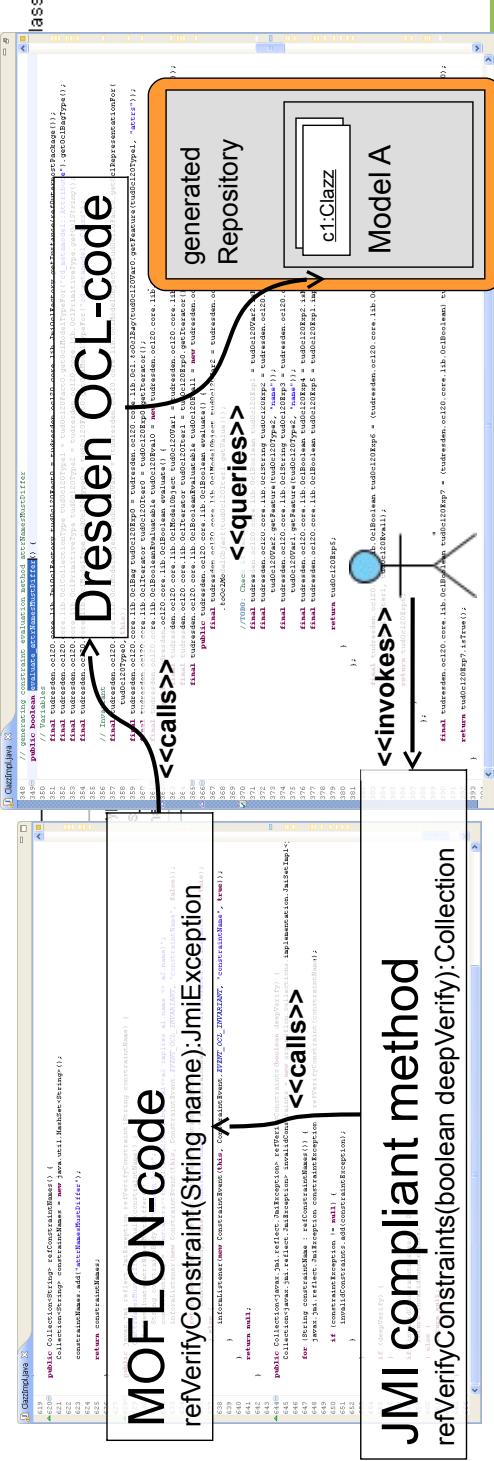

(OCL) Constraints in MOFLON – MOF Editor

- MOF allows to add constraints to every MOF element
- MOFLON has an underlying MOF metamodel repository
- MOFLON MOF editor may add constraints to elements

(OCL) Constraints in MOFLON – Generated Implementations

- MOFLON generates metamodel-based repositories (Java/JMI)
- MOFLON uses Dresden OCL to add constraint code to generated implementations
 - invariants (inv)
 - derived attributes (derive)
 - helper variables/functions

JMI compliant
method

```

    Collection<String> constraintNames = new java.util.HashSet<String>();
    constraintNames.add("attrNamesMustDiffer");

    return constraintNames;
}

public javax.jmi.reflect.JmiException reVerifyConstraint(String constraintName) {
    if ("attrNamesMustDiffer".equals(constraintName)) {
        if (evaluator.getAttributeNamesMustDiffer()) {
            String constraintBody = "unknown body";
            constraintBody = "inv.attr$>forall($1,$2:$1->$2 invinformListener($1,$2, ConstraintEvent($1,$2, ConstraintEvent(this, ConstraintEvent.EVERY)));
            return new javax.jmi.reflect.ConstraintViolationException(
                constraintBody, this, "constraint named " + constraintName);
        } else {
            informListener(new ConstraintEvent(this, ConstraintEvent.EVERY));
        }
    }
    return null;
}

public Collection<javax.jmi.reflect.JmiException> reverifyConstraints(Collection<javax.jmi.reflect.JmiException> invalidConstraints = new ArrayList<javax.jmi.reflect.JmiException>());
{
    for (String constraintName : refConstraintNames()) {
        javax.jmi.reflect.JmiException constraintException = reVerifyConstraint(constraintName);
        if (constraintException != null) {
            invalidConstraints.add(constraintException);
        }
    }
    if (deepVerify) {
        if (invalidConstraints.size() > 0) {
            return invalidConstraints;
        } else {
            return null;
        }
    }
}

```

```

Draft II August 2009

Result of MOFLON Example 1 – Statechart Editor (STaX)

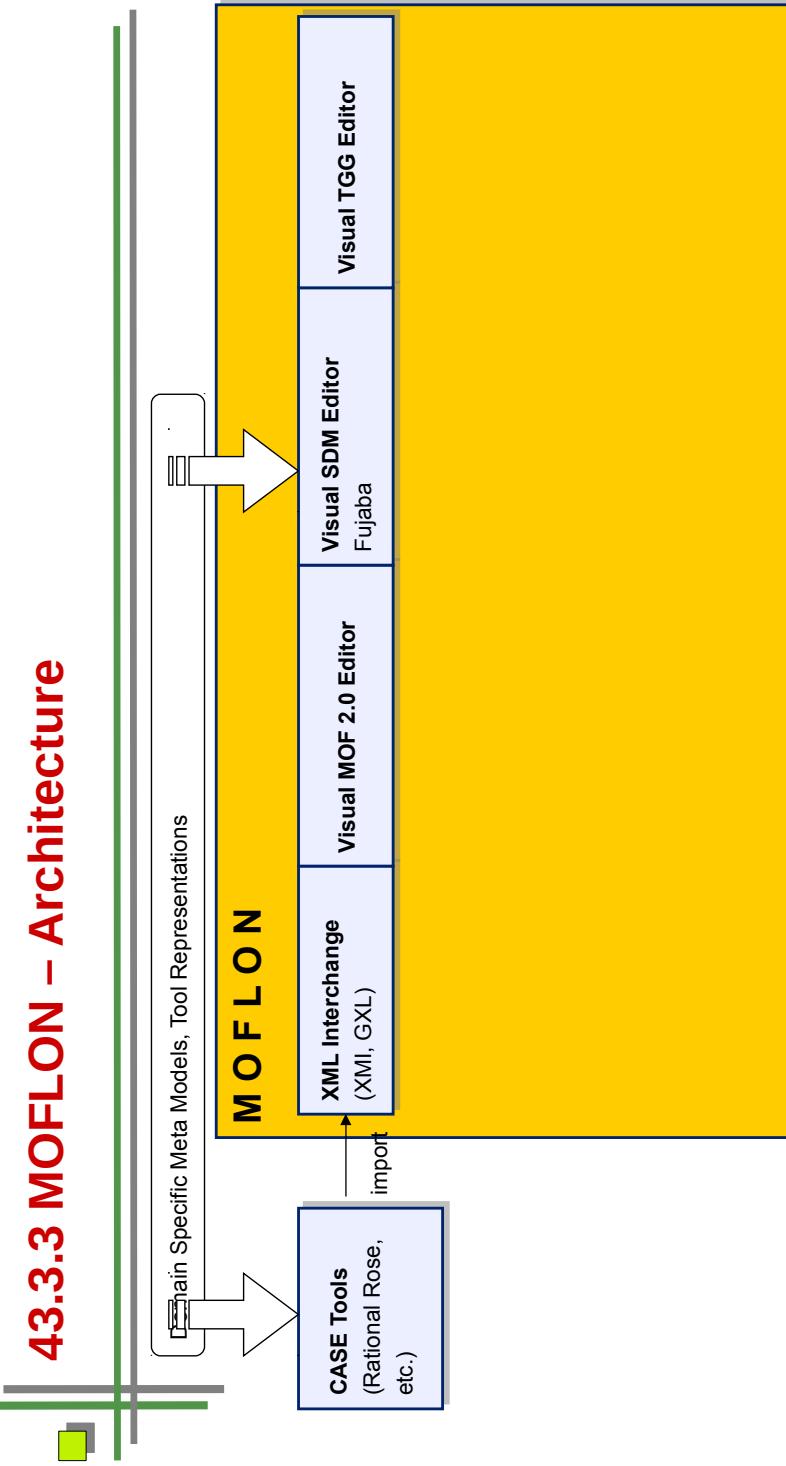

- Editor:
- data structure (MOFLON repository)
- GUI (GEF)

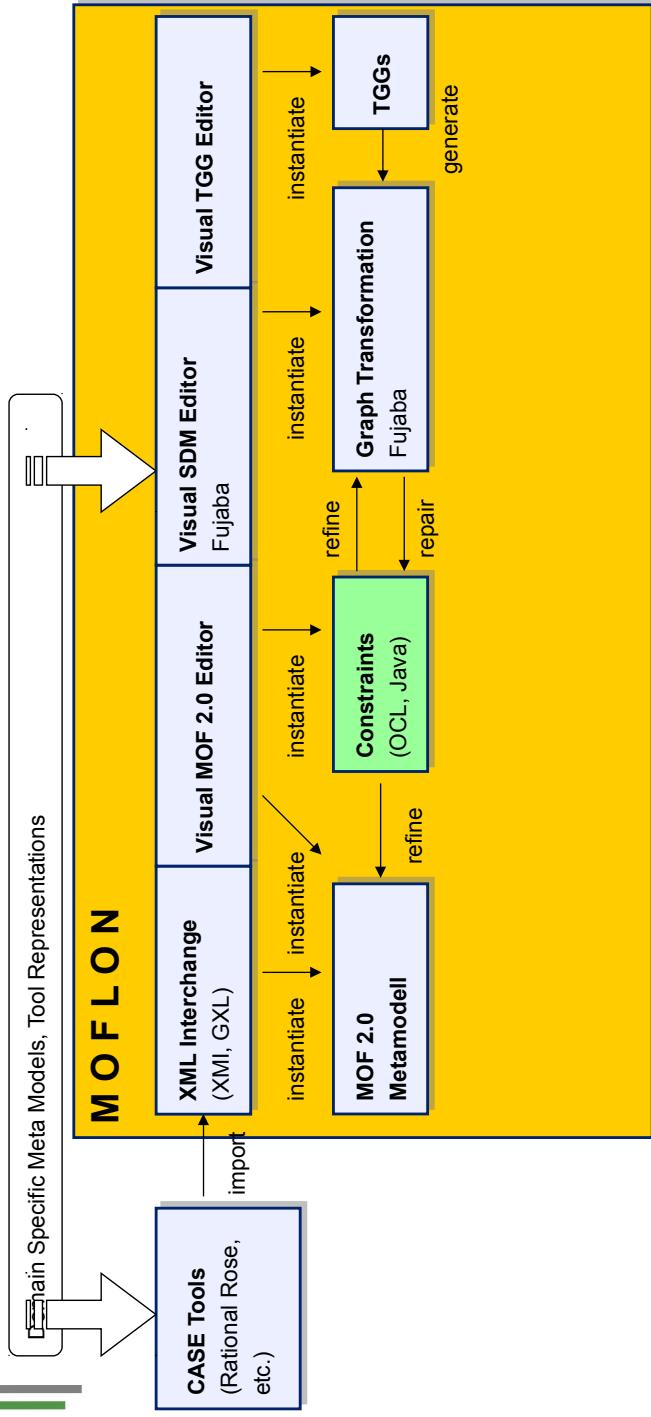

- MOFLON is mainly used to
 - integrate existing DSL tools
 - generate standard compliant metamodel implementations
 - specify transformations on instances of the metamodel

Future Work – OCL

- We bootstrap our MOFLON MOF Metamodel periodically
 - Add more OCL constraints to our MOF Metamodel
 - Regenerate MOFLON MOF implementation
 - Activate constraint checking in MOFLON (Model verification, model consistency checking, model wellformedness)

Model-Driven Software Development at Real-Time Systems Lab (Prof. Schürr)
