# Q12: A Software Factory's Heart: the Multi-TS Megamodel

A **software factory** schema essentially defines a recipe for building members of a software product family.

Jack Greenfield

# 40.1 Traceability between Models

# Why Traceability in a Megamodel?

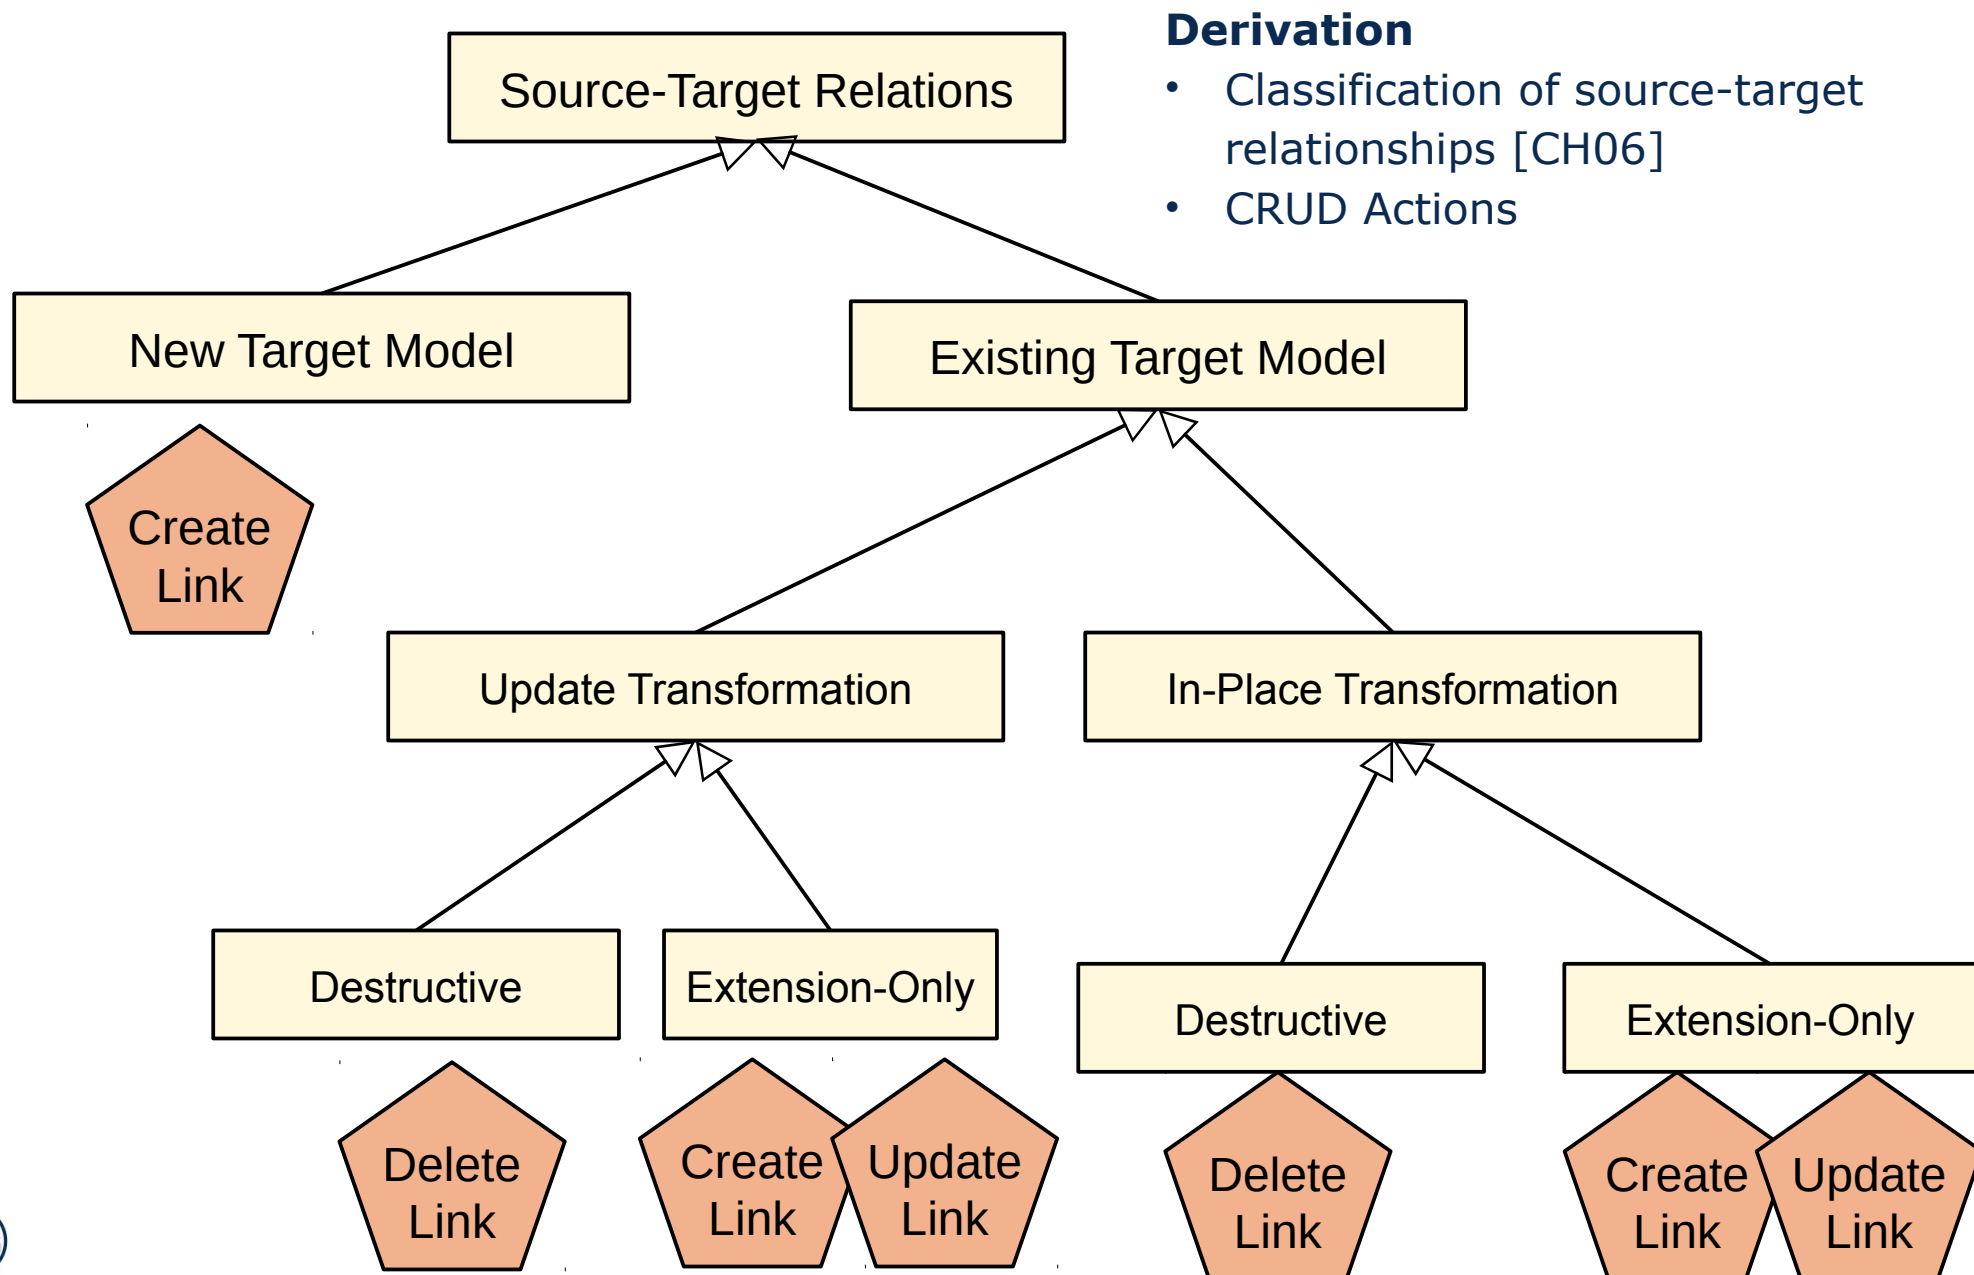

## System Comprehension:

- To improve orientation by navigating via trace links along model transformation chains
- ▶ **Change Impact Analysis:**
  - to analyze the impact of a model change on other models
  - to analyze the impact of a model change on existing *generated* or *transformed* output
  - To enable to do model synchronization (hot updating dependent parts)
- ▶ **Orphan Analysis:** finding orphaned elements in models

## Validation and Verification:

- ▶ **System Validation:** Connecting the requirements with the customer's goals and problems (see ZOPP method)
- ▶ **(Test) Coverage analysis:** to determine whether all requirements were covered by test cases in the development life cycle
- ▶ **Debugging:** To locate bugs when tracing code back to requirements
  - To locate bugs during the development of transformation programs

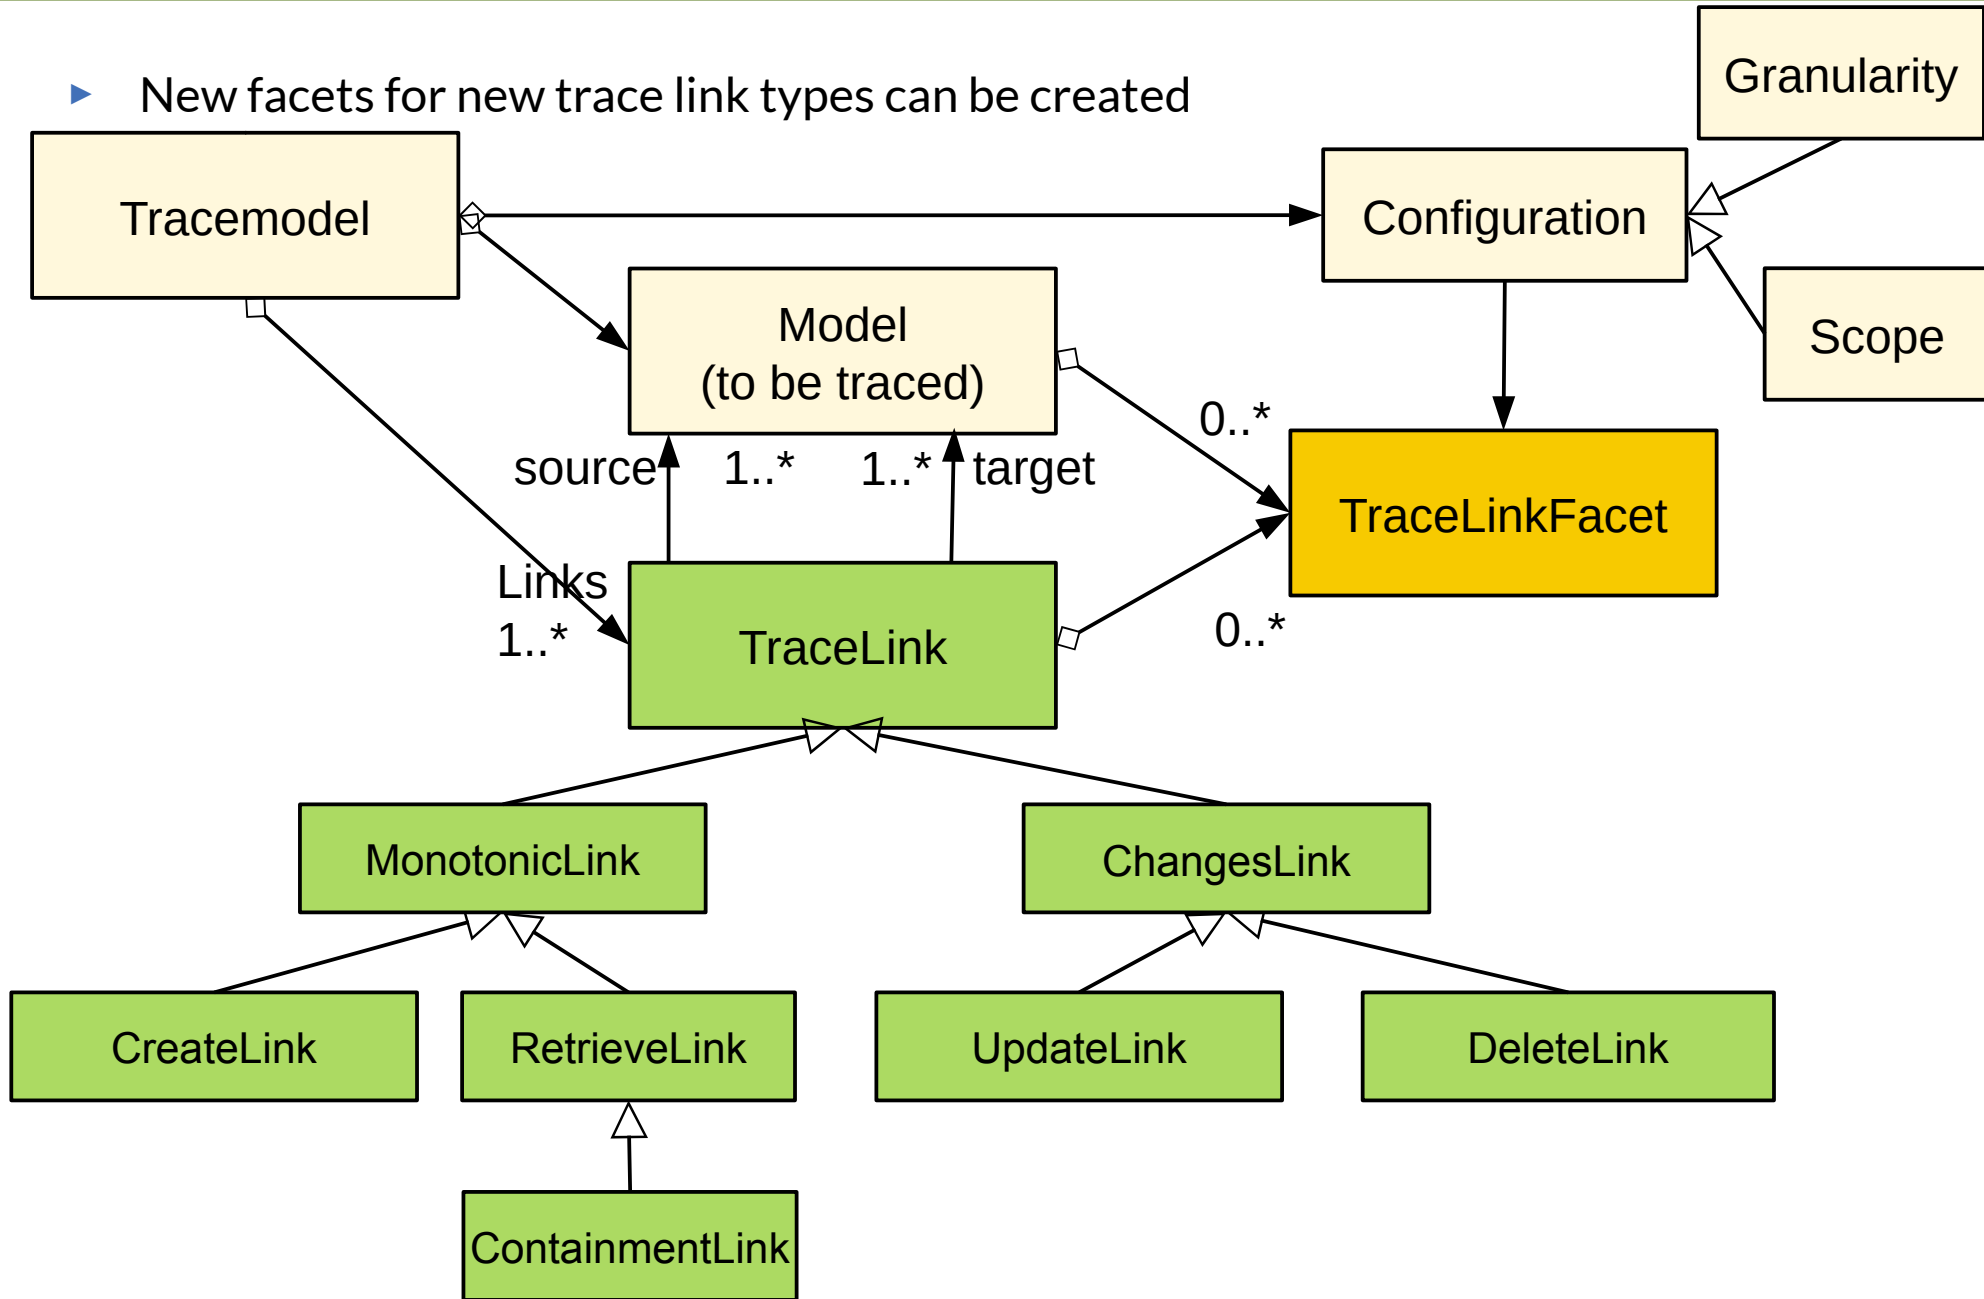

# Traceability Metamodel: CRUD Types of Trace Links between Model Elements of Different Models

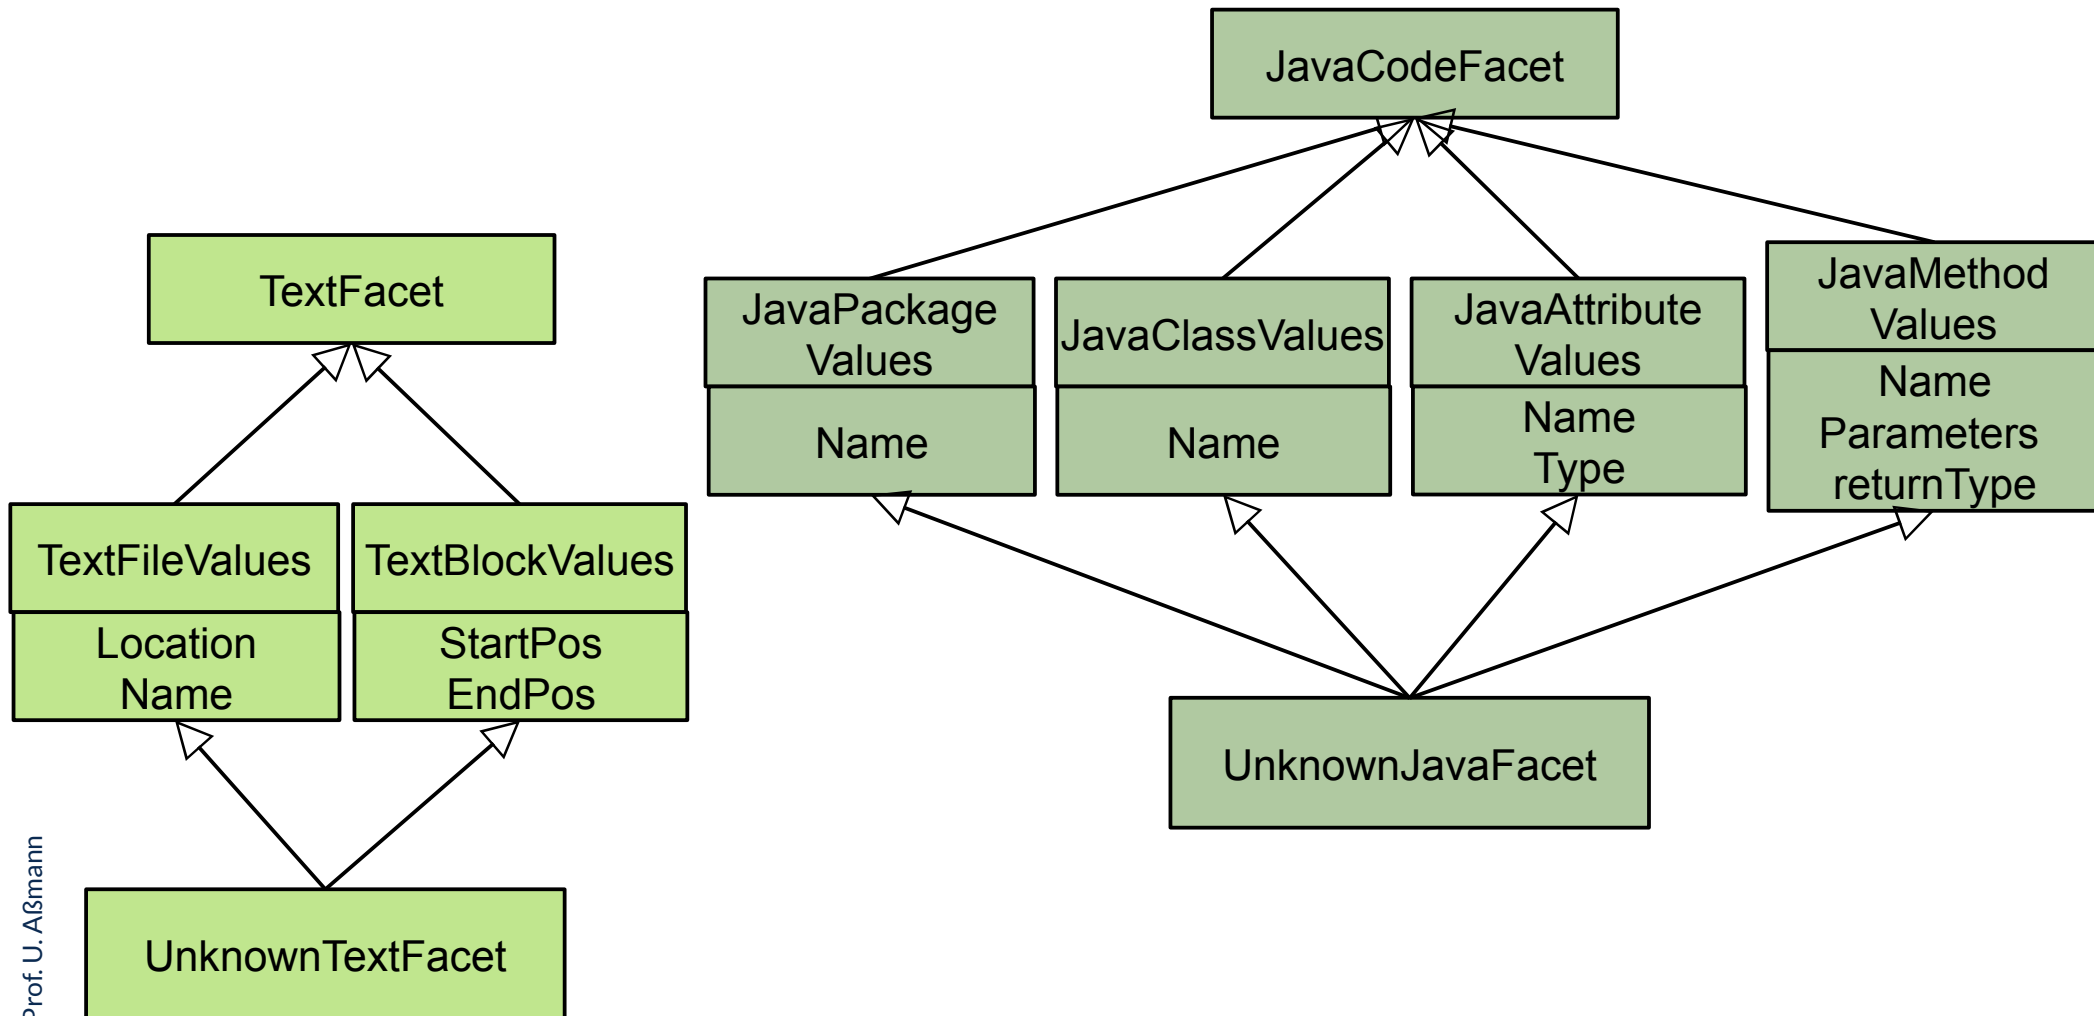

# Extensible Traceability Metamodel acc. to Grammel

- ▶ New facets for new trace link types can be created

# Examples for TraceLinkFacet

- Facets factorize inheritance hierarchies; new facets extend inheritance hierarchies

# Adding a Trace Link Generator to Tools

- ▶ TraceLinkGenerators can be connected in two ways, following a generic traceability interface:

Transformation engine must know and call the generator

Transformation engine need not know but is extended Invasively or by AOP

# Traceability in Megamodels

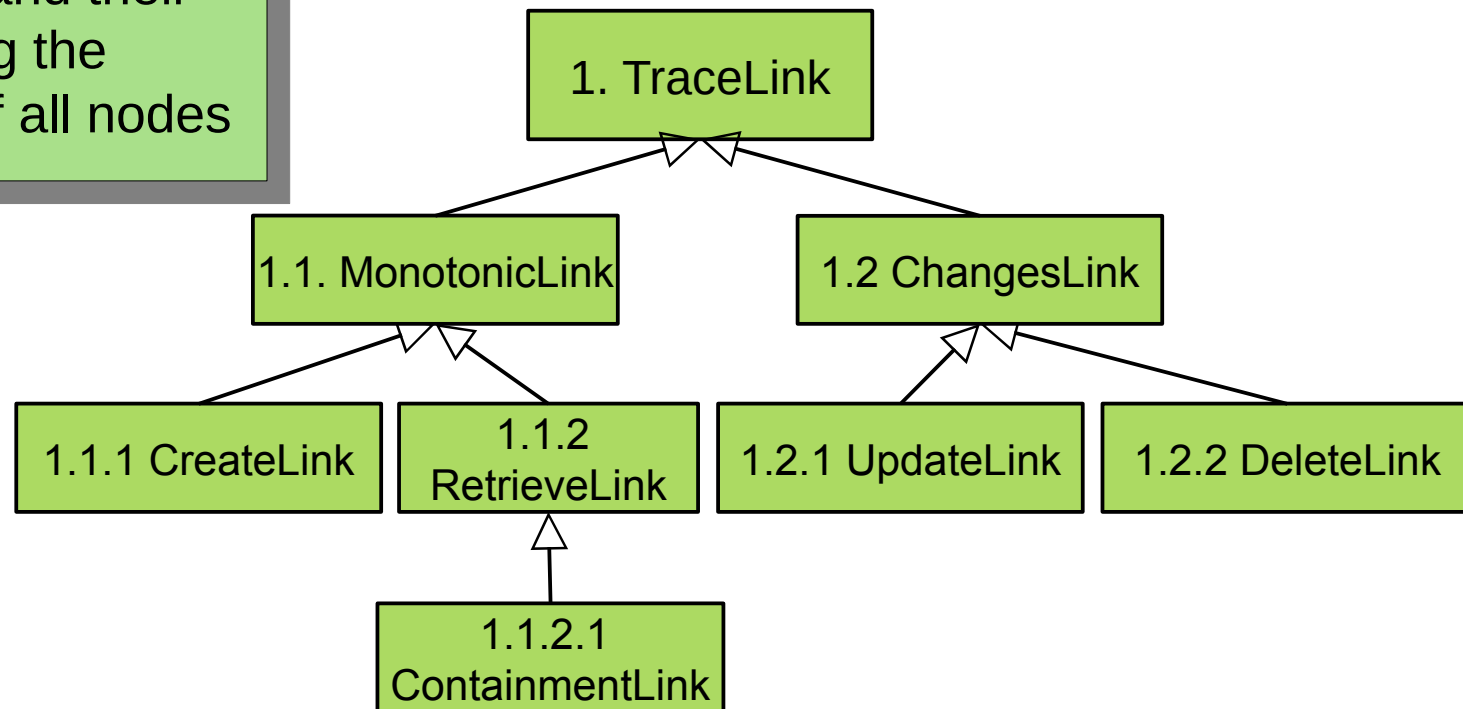

- ▶ Piecemeal growth of megamodels in the software process:
  - Start with requirements, then add more stuff and models
- ▶ **Add links**
  - **Create links** are drawn between model element MA from model A and model element MB whenever MB is generated or added because of MA
  - **Retrieve links** are drawn when MB is extracted from a model A and added to another model B
  - **Containment links** are drawn, when in a new model B the model element MA is contained in another model element MB'
  - **Delete links** are drawn if In model B the model element MB should be deleted
  - **Update links** are drawn if MA has changed and MB should be changed too

# Traceability in Megamodels with Models from Link-Treeware

- ▶ In link-tree models, a skeleton tree exists, in which every model element has a unique *tree node number (hierarchical number)*
- ▶ Trace links can be added with tree node number and stored externally of the model *in the megamodel*

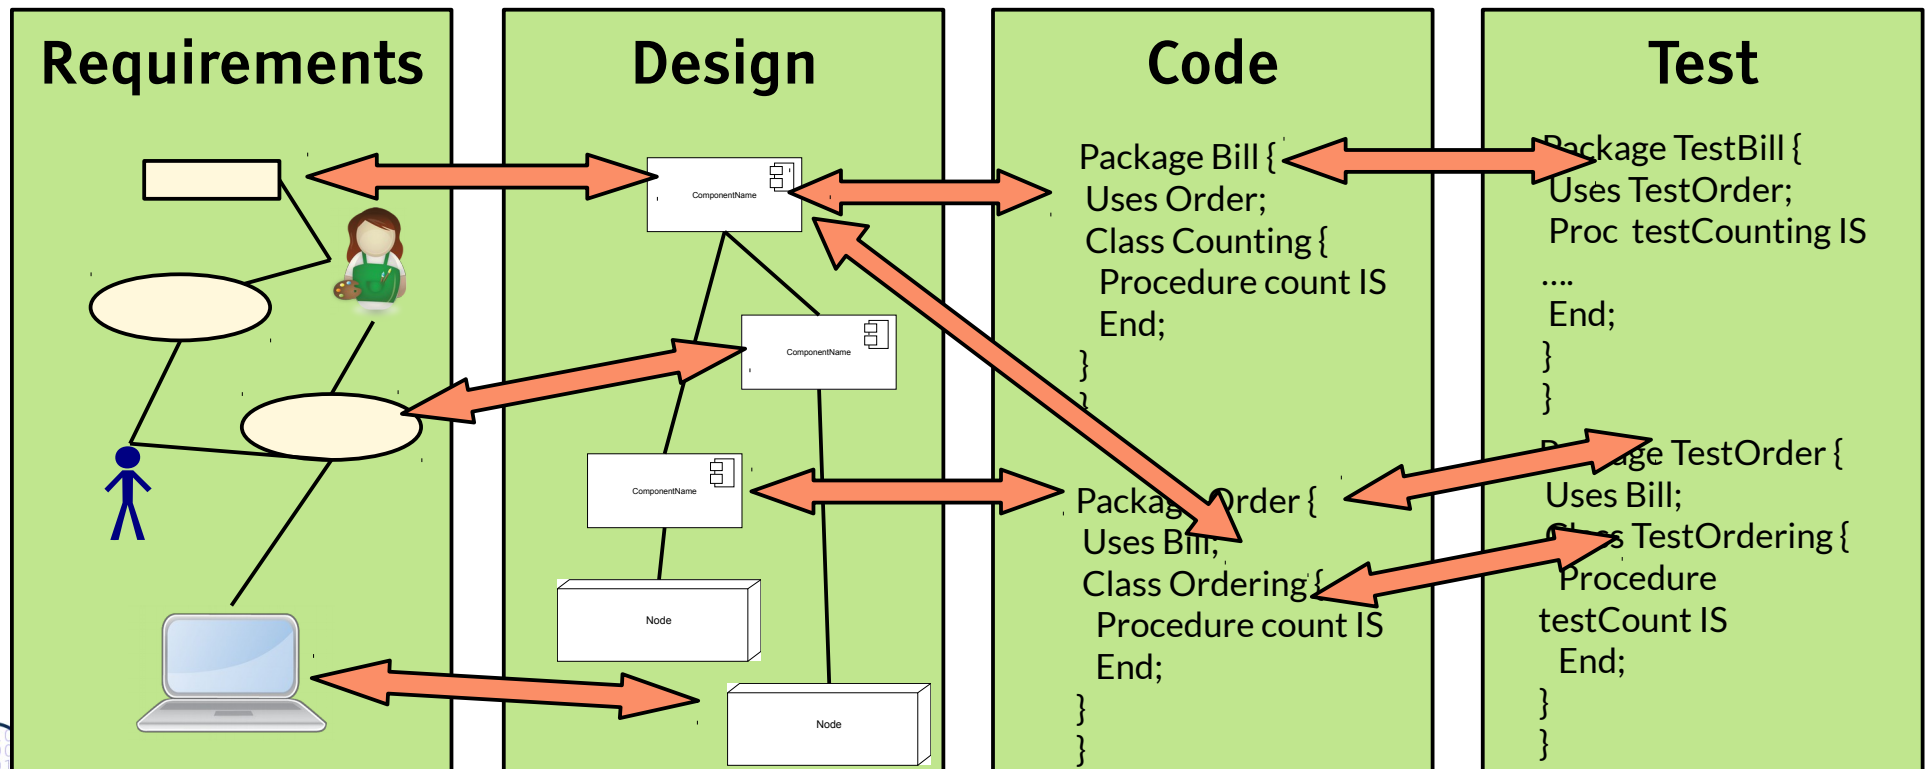

In link-treeware, megamodels maintain *tracelink models* linking and tracing all models and their elements by referencing the hierarchical numbers of all nodes

Hierarchical numbering of the classes in an inheritance tree:

# Q12: The ReDeCT Problem and its Macromodel

- ▶ The inter-model mappings between the Requirements, Design model, Code, Test cases are traceability links stemming for example from:
  - Lifted results of deep model analysis (reachability analysis)
  - Generated trace links from added trace link generators
- ▶ A ReDeCT macromodel has maintained intermodel mappings between all 4 models

## 40.2. Megamodels for Test and Requirements Management

# Introduction to Requirements Management (RM)

- ▶ RM bridges the needs of the customer to testing, design, coding, and documentation
- ▶ RM continuously manages requirements in the entire software life cycle
- ▶ RM relies on inter-model mappings between requirements, test cases, design, and code

# Tools in an Integrated Development Environment (IDE)

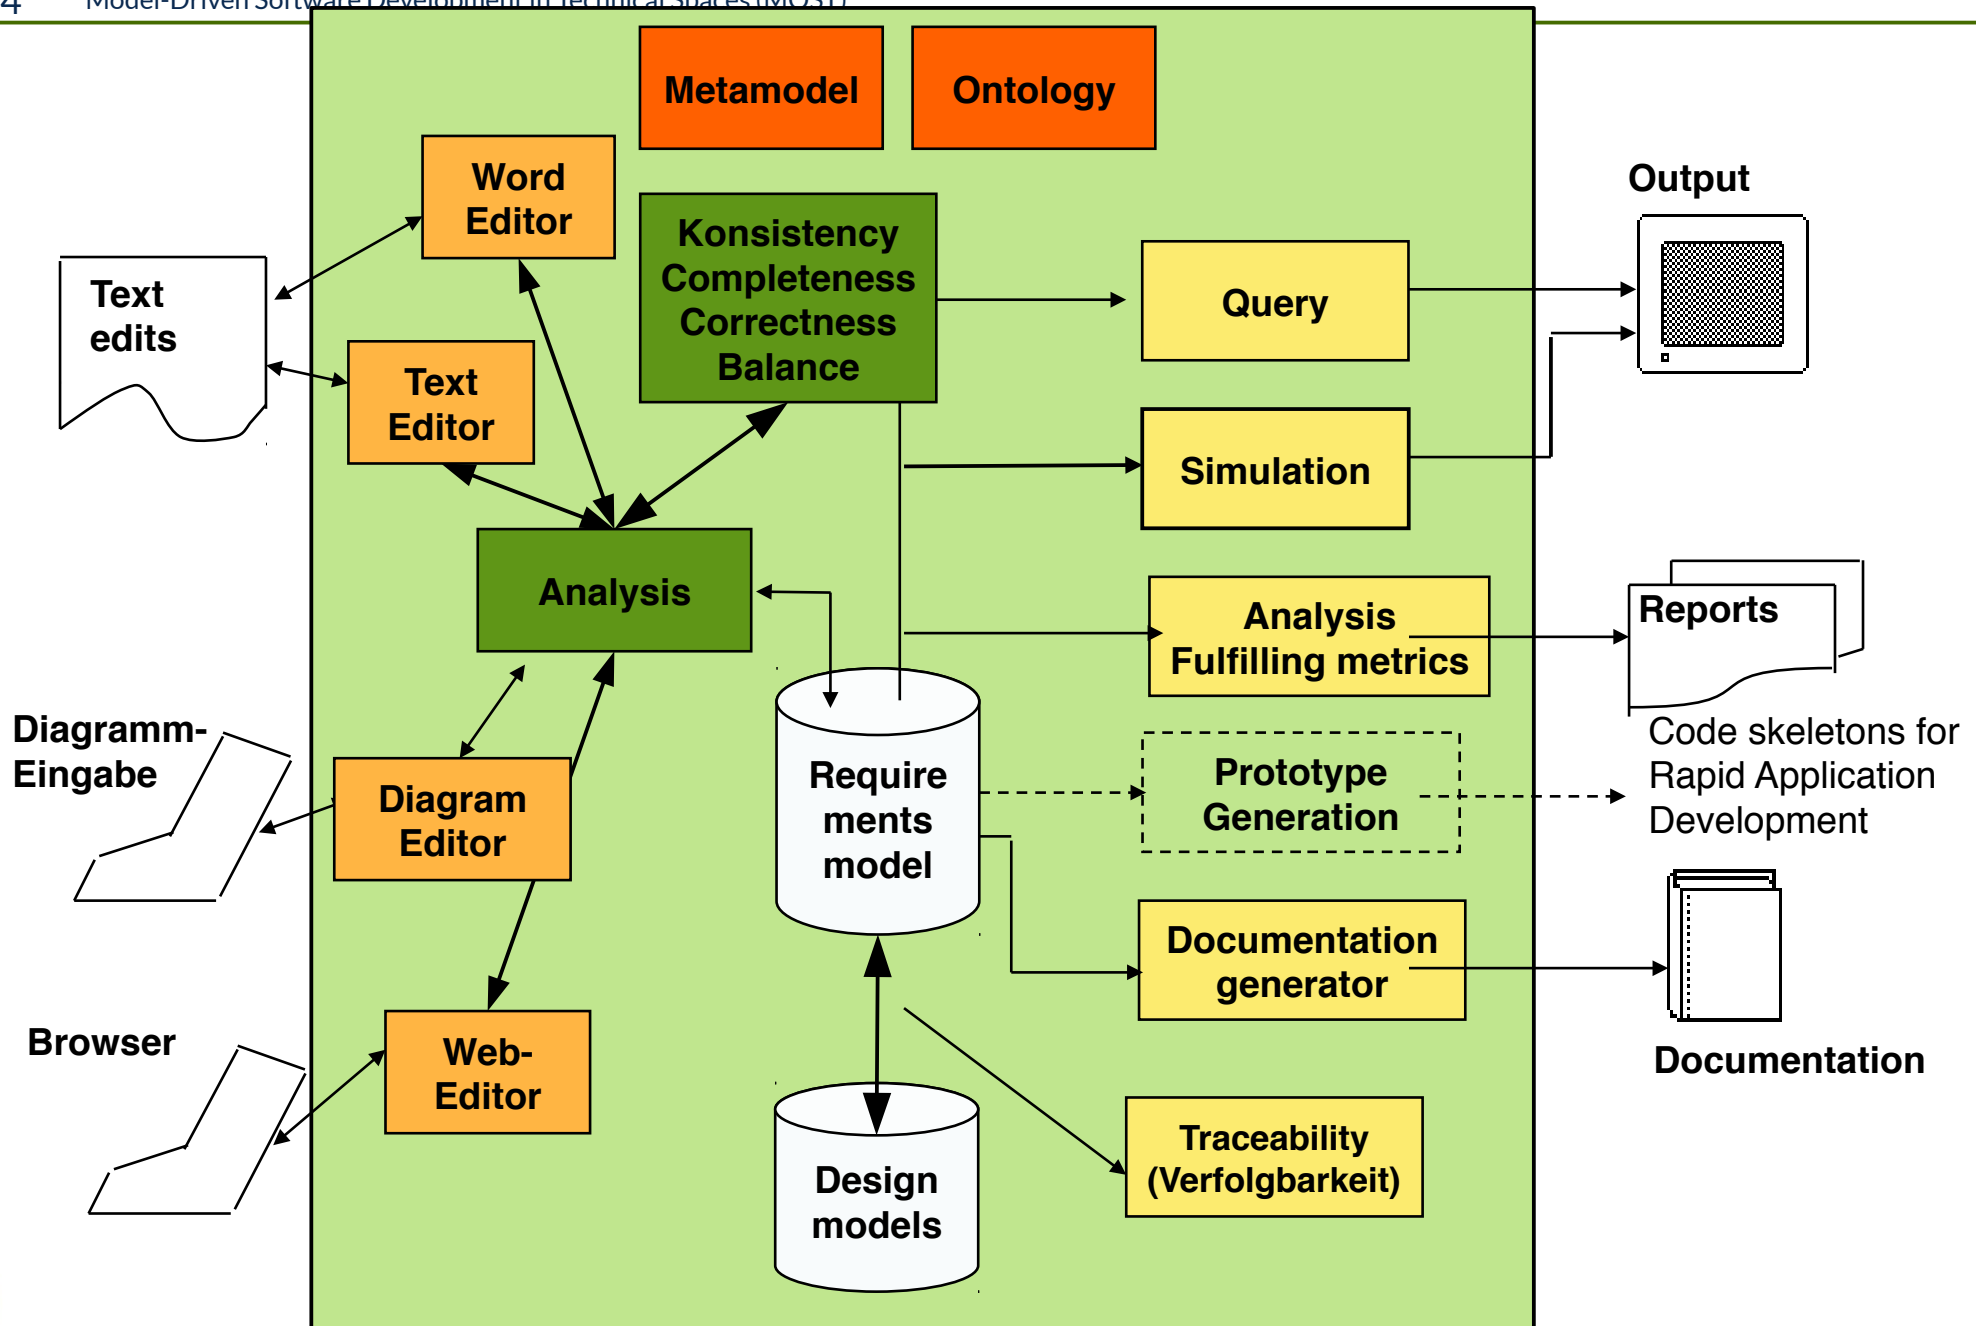

# Deficiencies of Current RE Methods

- ▶ Relationships among requirements are inadequately captured
  - Causal relationship between consistency, completeness and correctness [Zowghi2002]
  - Completeness and consistency are not verified
- ▶ Requirement problems (e.g. conflicts, incompleteness) are detected too late or not all
- ▶ Relationships between requirements and dependent artifacts are insufficiently managed (test, documentation, design, code)
- ▶ Desirable:
  - Models for RE need richer and higher-level **abstractions** (goals, problems, needs) to validate that they are fulfilled [Mylopoulos1999]
    - Metamodels can be used to define these concepts
    - Ontologies deliver reasoning services
  - **Model mappings (direct and indirect)** between the artifacts (design, code) and the goals, problems, needs of the customer
    - Based on the model mappings, the requirements are consistently managed with design, code, and documentation

# 40.2.2 Metamodel-Based Requirements Management

# Requirements Tools on the Requirement Database

# Metamodeling of Requirements

- ▶ Metamodeling is very helpful in RM
  - Requirements are domain-specific, i.e., need domain models
  - The granularity of requirements is very different, and need to be balanced
    - → metamodeling helps to type the requirements
  - Requirements can be treated as models, and **model mappings** can map them to design, implementation, and test models (**traceability, Verfolgbarkeit**)
- ▶ Many requirement tools are metamodel-controlled
  - typing requirements
  - linking them

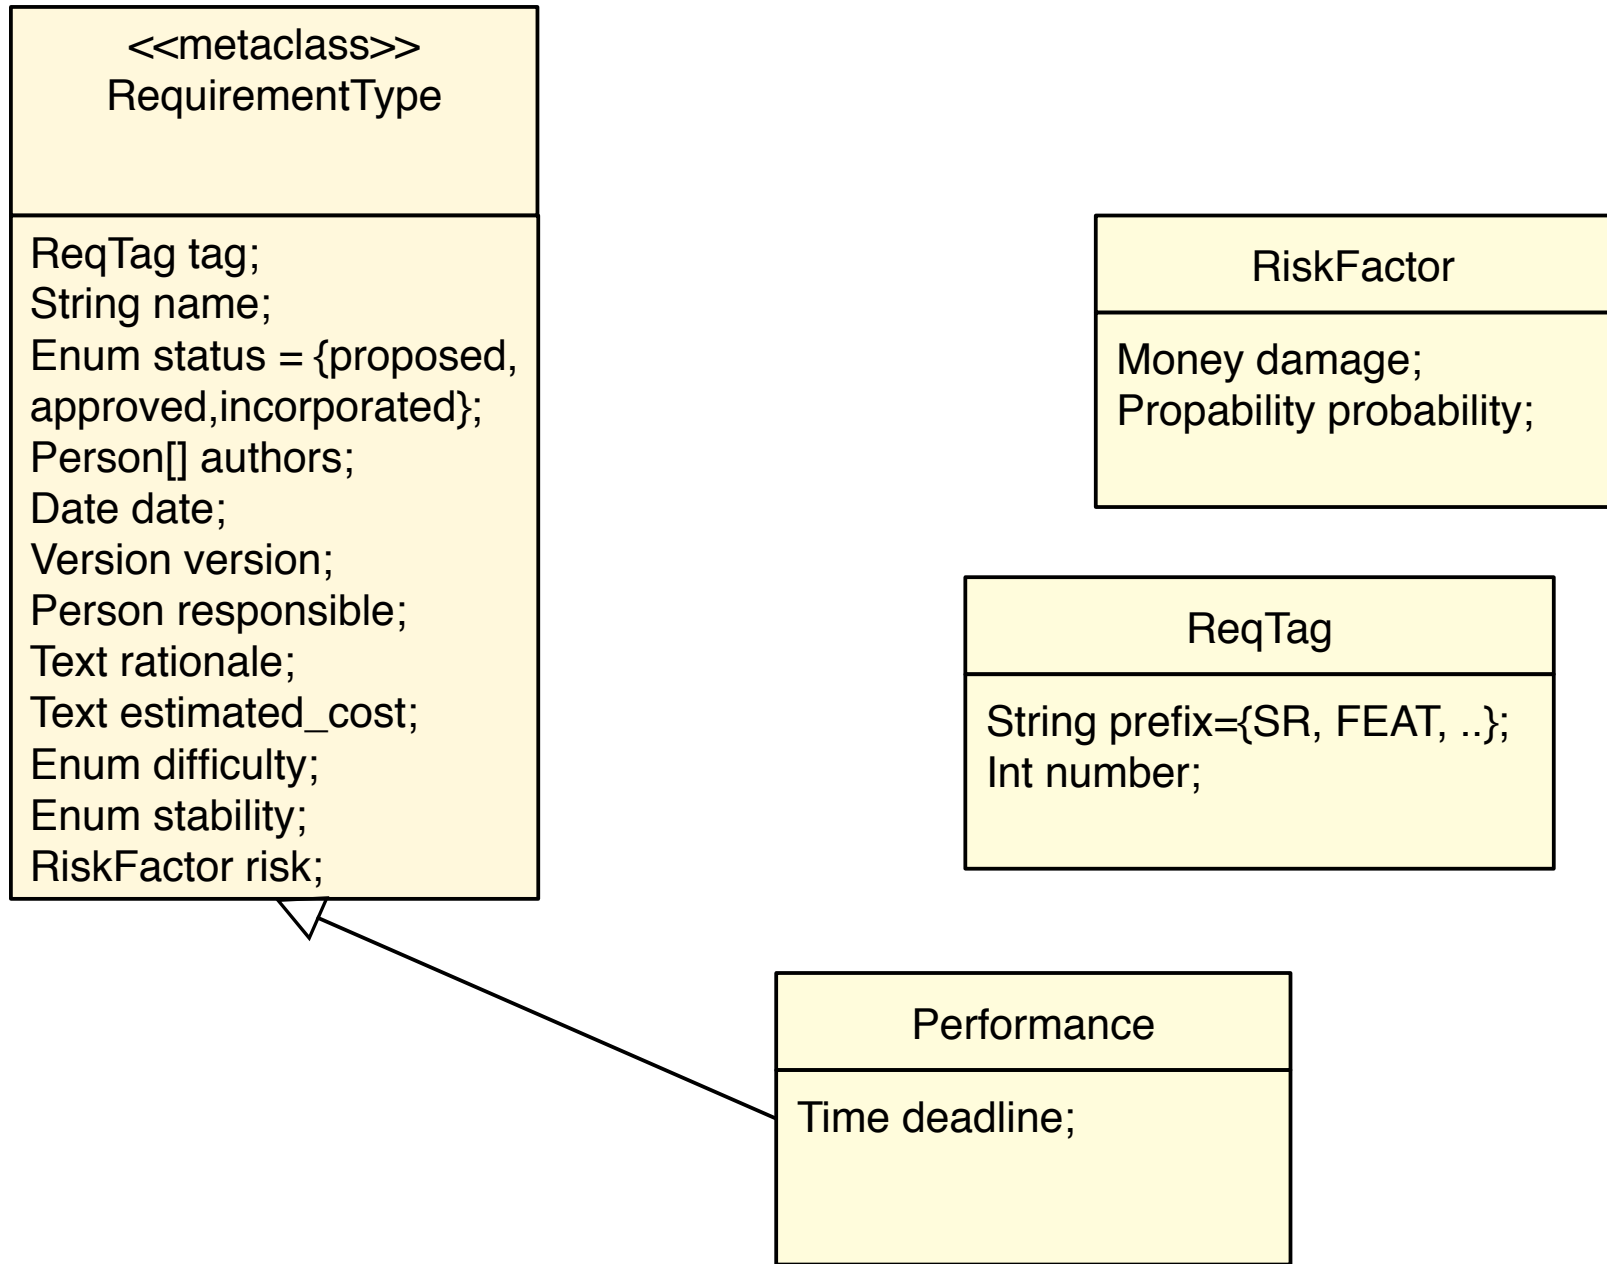

## 40.2.3 Requisite Pro

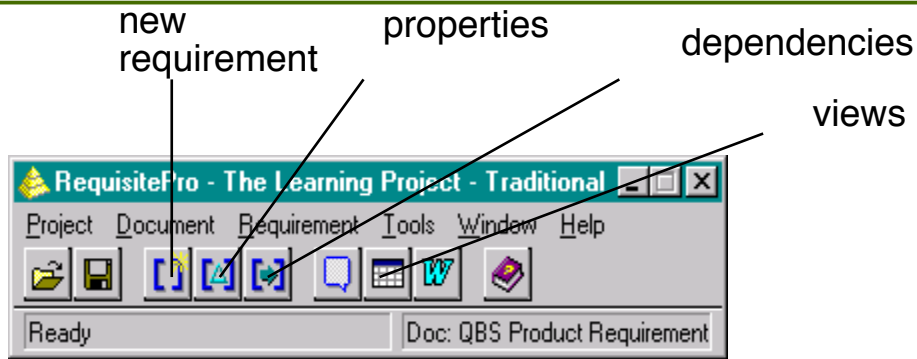

- ▶ **Metamodel-driven Repository of requirements (requirements database)**
  - Metamodel for requirements (**requirement types**) in metalanguage ERD
    - Attributes: Status, Priority, Difficulty, Stability, Costs
    - Dependencies and traces of requirements
    - Hierarchical requirements
    - Views on requirements
  - Query facility; configuration management
  - Integration into processes and IDE, e.g., Rational Unified Process with Rational Rose UML, ClearCase and MS Project.
- ▶ **Traceability Matrix** allows for linking requirements with test cases (direct inter-model mapping)
- ▶ Create **software requirements specifications (SRS)** with template documents:
  - Support of different types of SRS (system product, software, service).

# Metaclass RequirementType (Ex.)

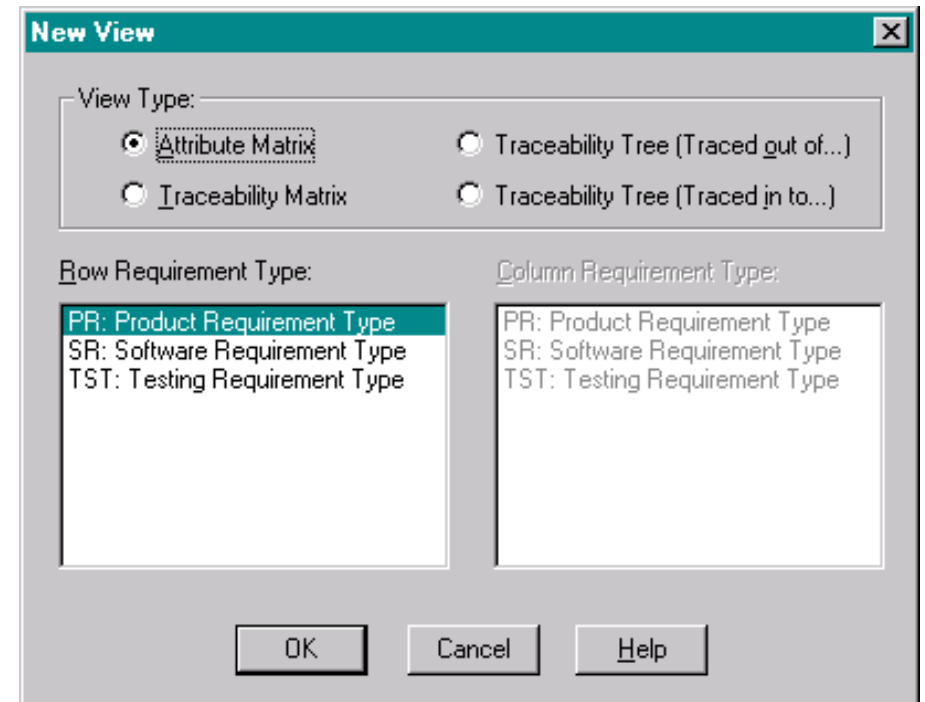

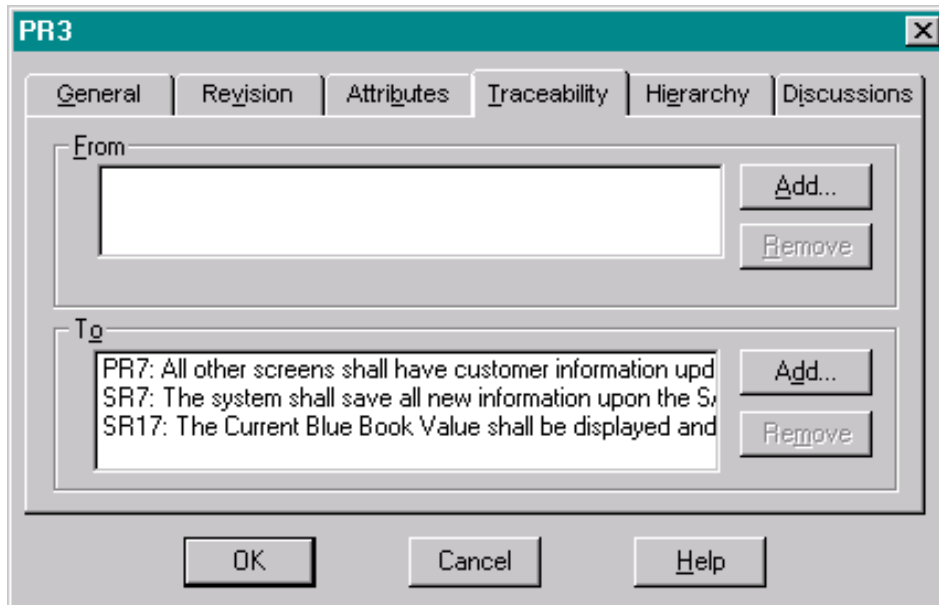

# RequisitePro – Main Windows

Selection of different requirements types and views

## Description of Requirement PR3

# FURPS Classification of Requirements

FURPS delivers RequirementTypes for RequisitePro

[Wikipedia] [Grady/Caswell] in Hewlett-Packard

- ▶ **Functionality** - Feature set, Capabilities, Generality
  - Semi-functionality: Security
- ▶ **Qualities:**
  - **Usability** - Human factors, Aesthetics, Consistency, Documentation
  - **Reliability** - Frequency/severity of failure, Recoverability, Predictability, Accuracy, Mean time to failure
  - **Performance** - Speed, Efficiency, Resource consumption, Throughput, Response time
  - **Supportability** - Testability, Extensibility, Adaptability, Maintainability, Compatibility, Configurability, Serviceability, Installability, Localizability, Portability

# FURPS+ (FURPS-DIIP)

- ▶ IBM: <http://www.ibm.com/developerworks/rational/library/4706.htm>
- ▶ <http://www.ibm.com/developerworks/rational/library/4708-pdf.pdf>
- ▶ **Design Requirement:** a constraint on the design of a system
  - Architecture Requirement: a constraint on the architecture
- ▶ **Implementation Requirement:** a constraint on the code of the system
- ▶ **Interface Requirement:** a constraint on the external interfaces of the system (the “context model”)
- ▶ **Physical Requirement:** a constraint on the hardware environment

# Attribute Matrix of Requisite Pro

- ▶ The attribute matrix is a hierarchical table (relation) of requirement objects and their attributes
  - Super and subrequirements
  - Priority and Status, and other attributes

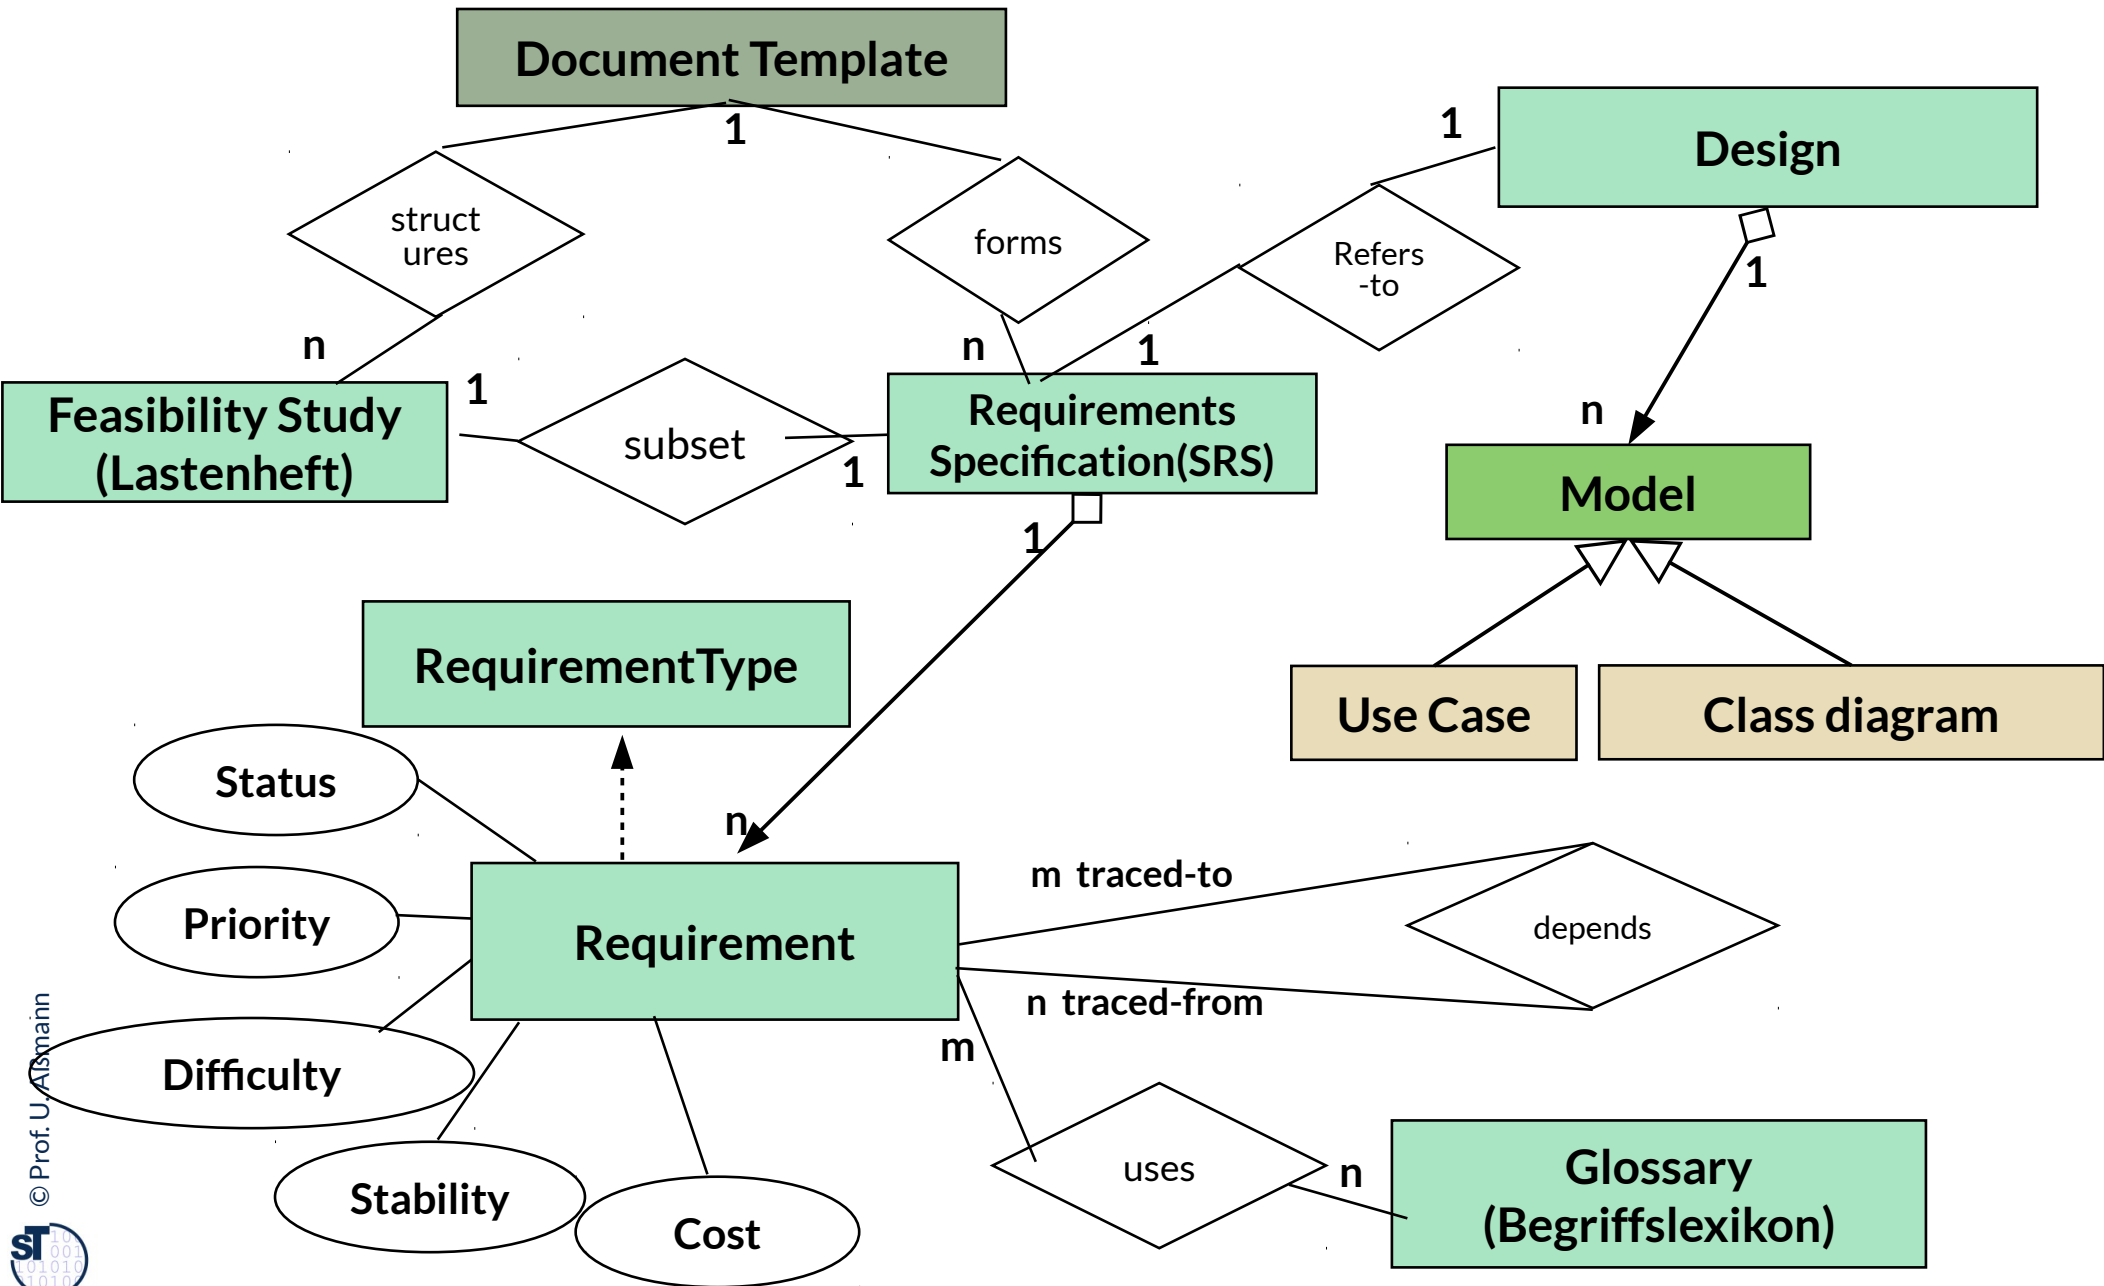

# Formalizing Requirement Texts

- ▶ If requirements are entered in free text (in Word processor), they can be **formalized by text mining** with
  - Verb-noun-analysis
  - Keyword identification: MUST, MAY, SHALL, SHOULD, WILL, CUSTOMER
  - Markup information, such as section headers, emphasizing, etc.
  - Concept recognition by looking up nouns in domain models (glossaries, taxonomies, ontologies)
- ▶ Requirements can also be recognized from tables in Word documents [RPro]

# Traceability with Direct Model Mappings

- ▶ The Traceability Matrix connects and relates requirements by **direct traces** and **indirect traces** over **trace\_to** and **trace\_from** relationships
  - The trace relationship is a model mapping within the requirements model
  - External projects can be imported, and traces to their public requirements can be defined
- ▶ Direct traces are entered
  - into a form
  - into the corresponding bitfield of the traceability matrix
- ▶ If somebody changes the requirements later, the trace links become **suspect** and should be checked

# Metamodel of Requirements Managements in RequisitePro (Metalanguage ERD)

# Other Tools

CaliberRM	Borland	<a href="http://www.borland.com/us/products/caliber/index.aspx">http://www.borland.com/us/products/caliber/index.aspx</a>
DOORS	IBM	<a href="http://www-01.ibm.com/software/awdtools/doors/">http://www-01.ibm.com/software/awdtools/doors/</a> <a href="http://www.docstoc.com/docs/90794258/Getting-the-most-out-of-DOORS-for-requirements---NJIT-Computer">http://www.docstoc.com/docs/90794258/Getting-the-most-out-of-DOORS-for-requirements---NJIT-Computer</a>

## 70.3 Traceability in Practical RM Tools

- ▶ With a **direct model mapping**, a requirements model can be linked
  - to a test case specification
  - to a documentation
  - to an architectural specification
  - via the architectural specification, to the classes and procedures in the code

# Model Mapping in MID INNOVATOR

39

Model-Driven Software Development in Technical Spaces (MOST)

- ▶ Innovator can be employed simultaneously for requirements, design and implementation models
- ▶ How to relate these models?

The screenshot shows the INNOVATOR software interface. The title bar reads "UML-Modell 'TTBib\_UML.ino\_prak2' - INNOVATOR". The menu bar includes "Element", "Bearbeiten", "Ansicht", "Modell", "Engineering", "Wechseln", "Extras", and "Hilfe". The toolbar contains various icons for file operations and model management. The left pane shows a project tree for "TTBib\_UML" with sub-elements: "systemModel", "external object" (with path "\$INOTMP/docs"), "Use Case System", "analysis system", "Java design system", "Java implementation system" (with path "\$INOTMP/src"), and "systemModel management". The right pane displays a table of model elements.

# Direct Model Mappings between Requirements and Test Tools

- ▶ Most often, these tools are in Link-treeware (hierarchical requirements, hierarchical test cases and test suites)
- ▶ → The trace models can be stored externally in the megamodel
  - Every trace link refers to link-tree node numbers in the requirements and test specifications

# 40.4 Traceability to Goals in Goal Models with Ontology-Driven Requirements Engineering (ODRE)

und Kultur

# Why Ontology-Driven Requirements Engineering (ODRE)?

45

Model-Driven Software Development in Technical Spaces (MOST)

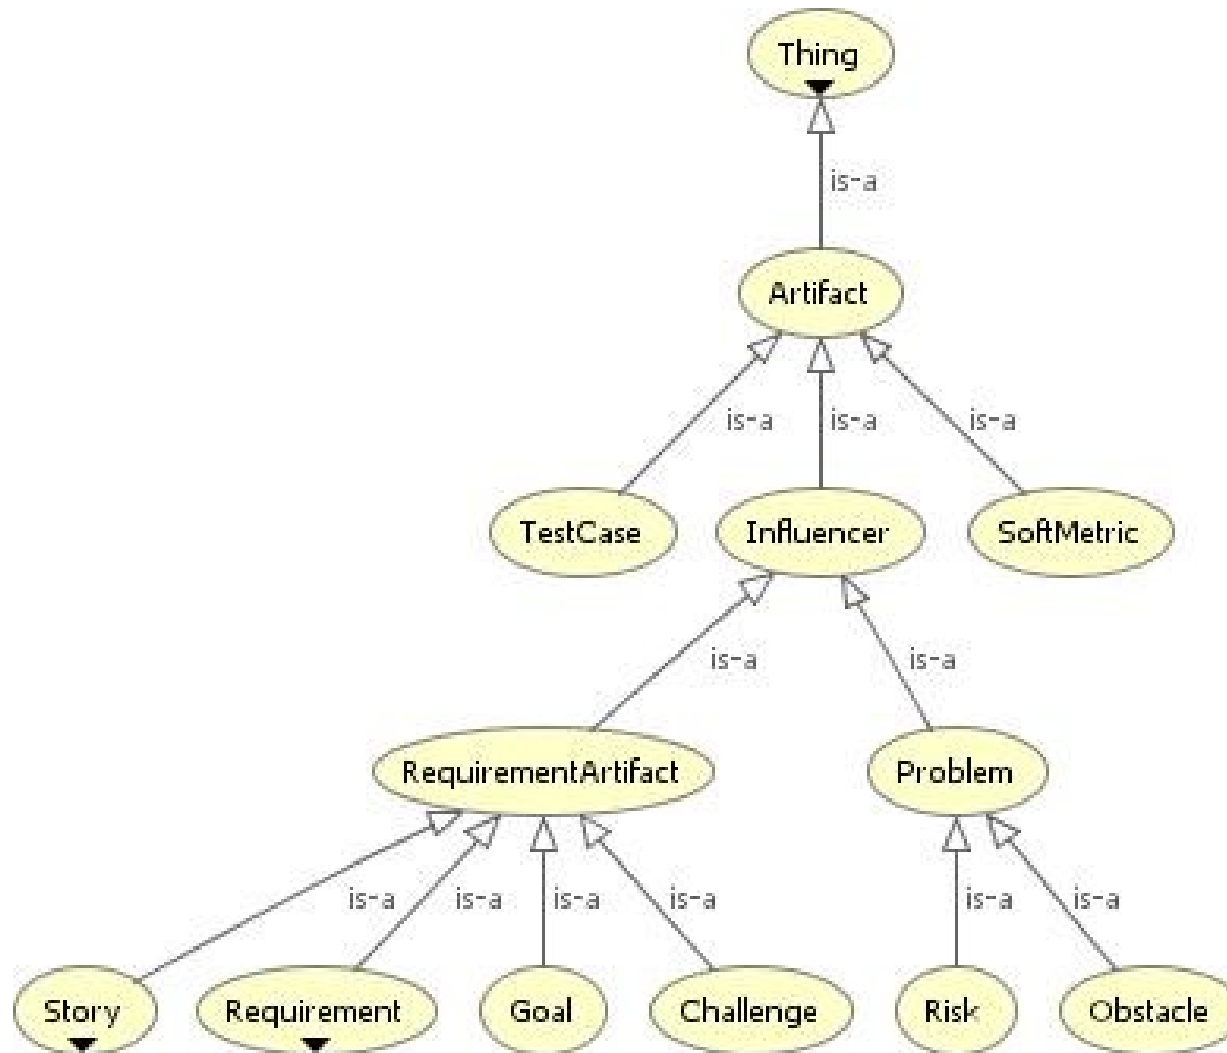

- ▶ Objective: Trace **goals from a goal model to requirements to designs and domain models**
- ▶ Use graph-logic isomorphism to store requirements and their requirement types in logic, more precisely, in an OWL ontology
  - Provide a metamodel (T-Box of requirements ontology) with a huge set of relevant metadata and requirement relationships
- ▶ Use reasoning services to
  - provide meaningful checks for completeness and consistency, e.g., as queries to the A-Box with SparQL
  - Make specific suggestions to repair inconsistencies and incompleteness
- ▶ Ontology consists of T- and A-Box
  - TBox (Terminological Box) provides metadata
  - ABox (Axiom Box, Fact Base) provides requirements, goals, relationships,...

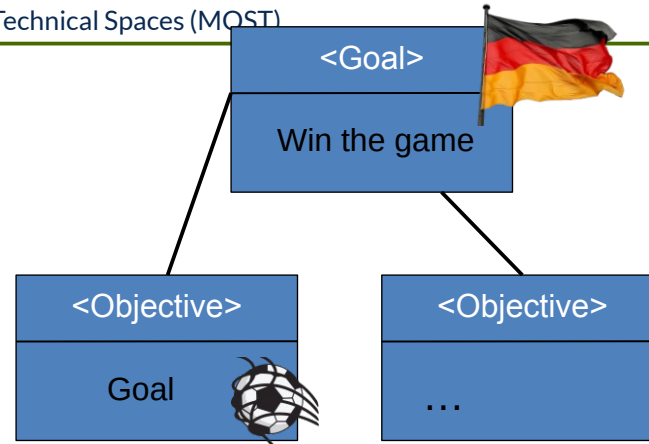

# ODRE Needs Goal-Oriented RE (GORE)

- ▶ Lamsweerde defines **goals** as "declarative statements of intent to be achieved by the system under consideration" [Lamsweerde2000]
- ▶ Benefits of explicit specification of goals in GORE:
  - Goals drive the identification of requirements
  - Goals provide a criterion for sufficient completeness of a requirement specification
    - Specification of pertinent requirements
    - Relationships between goals and requirements can help to choose the best one
  - Concrete requirements may change over time whereas goals pertain stable

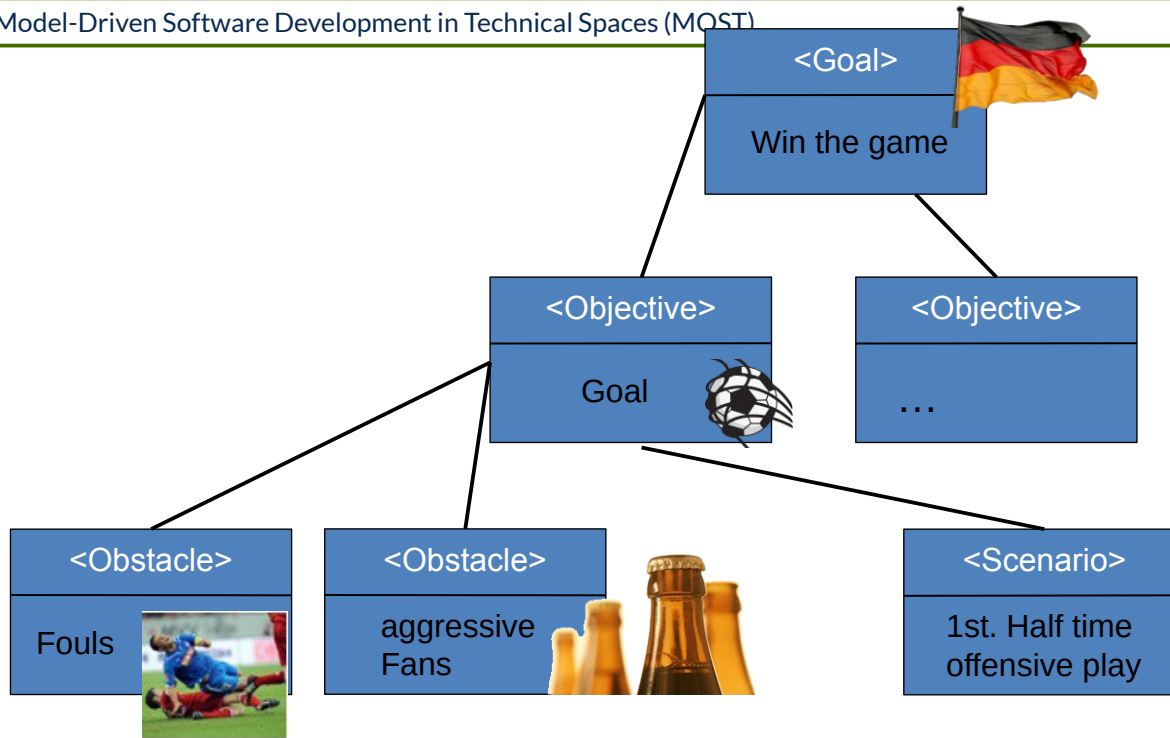

# Goal-Oriented Requirements Engineering (GORE) – TBox of GORE Ontology

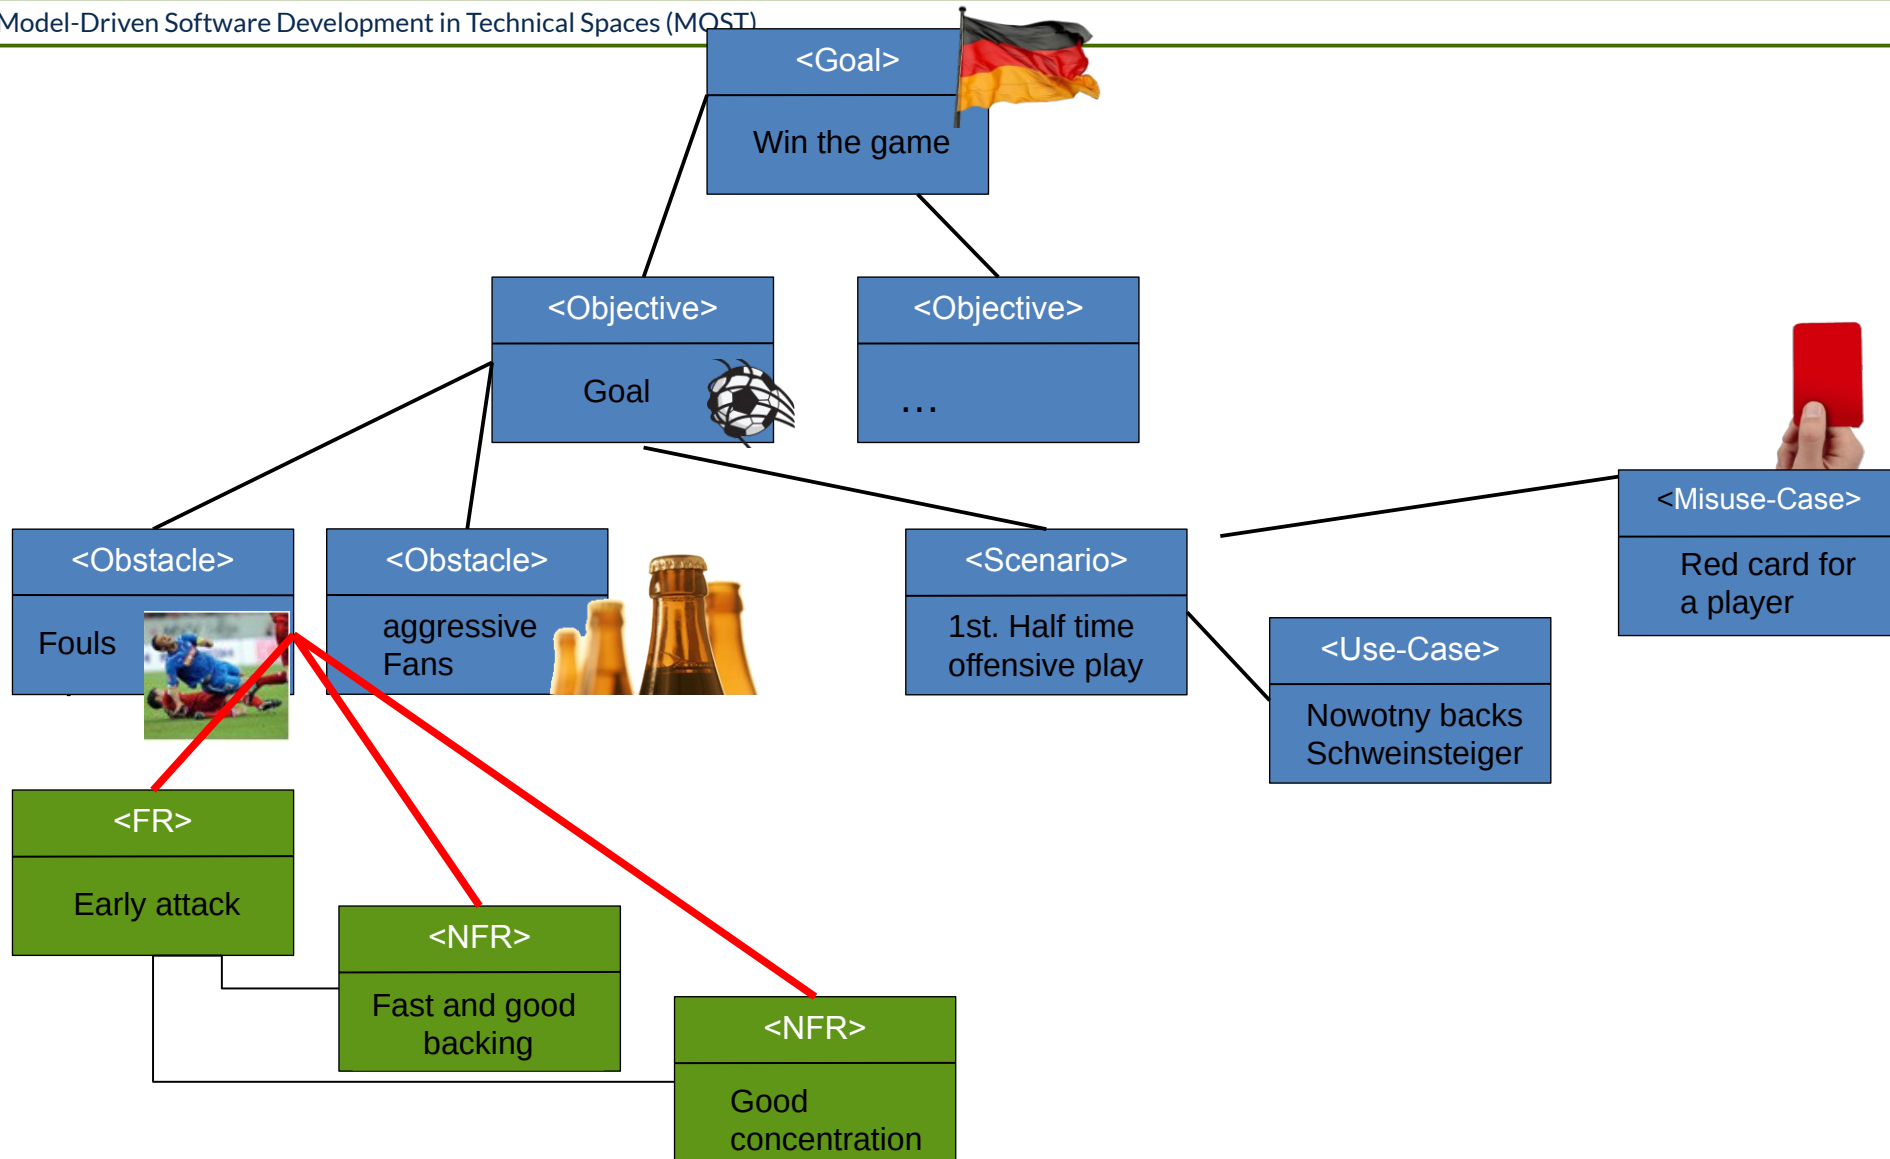

# Goal-Oriented RE (Motivation Example)

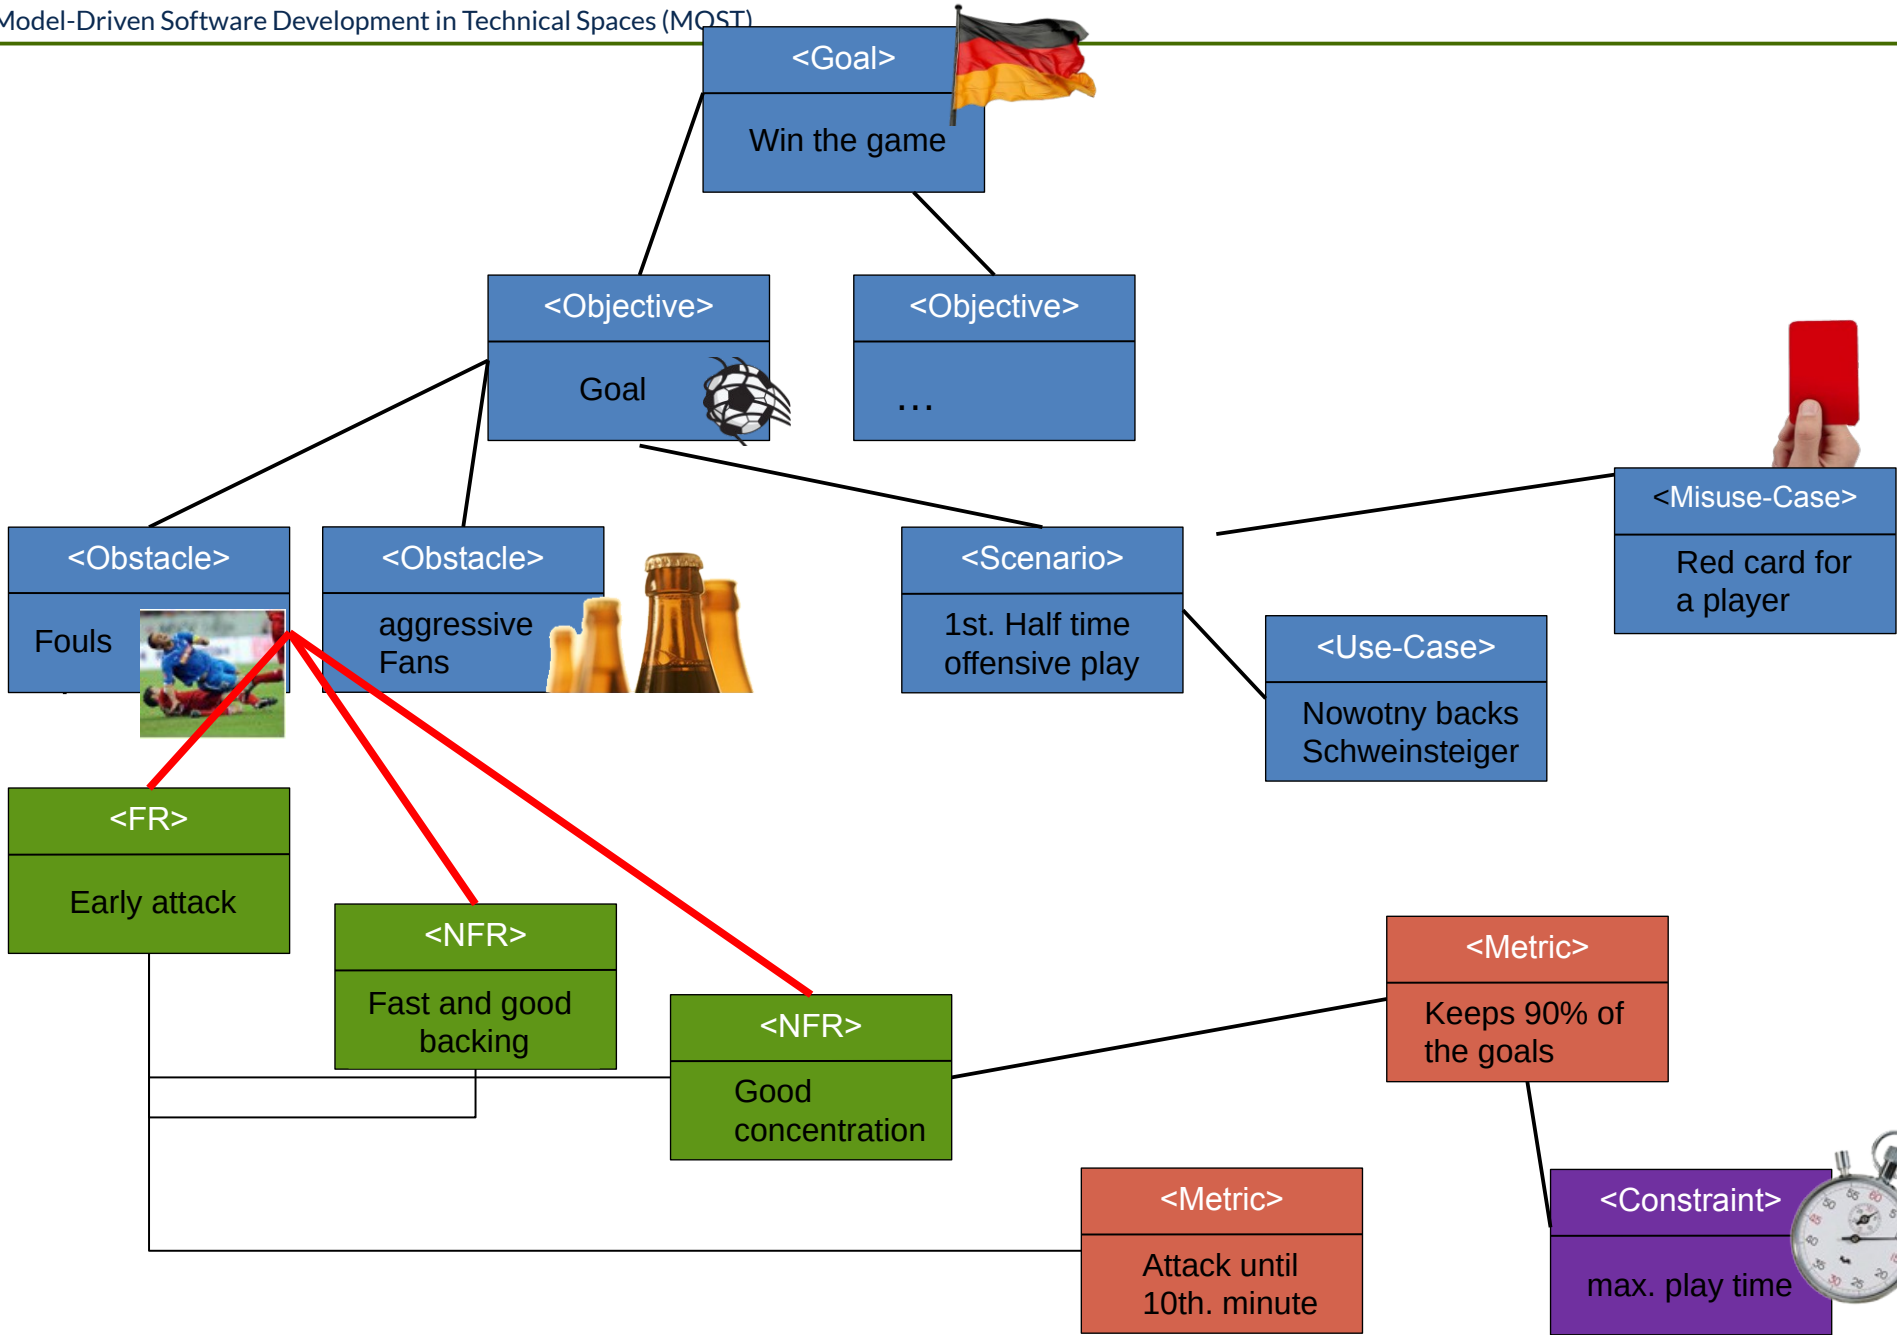

# Goal-Oriented RE (Motivation Example)

# Goal-Oriented RE (Motivation Example)

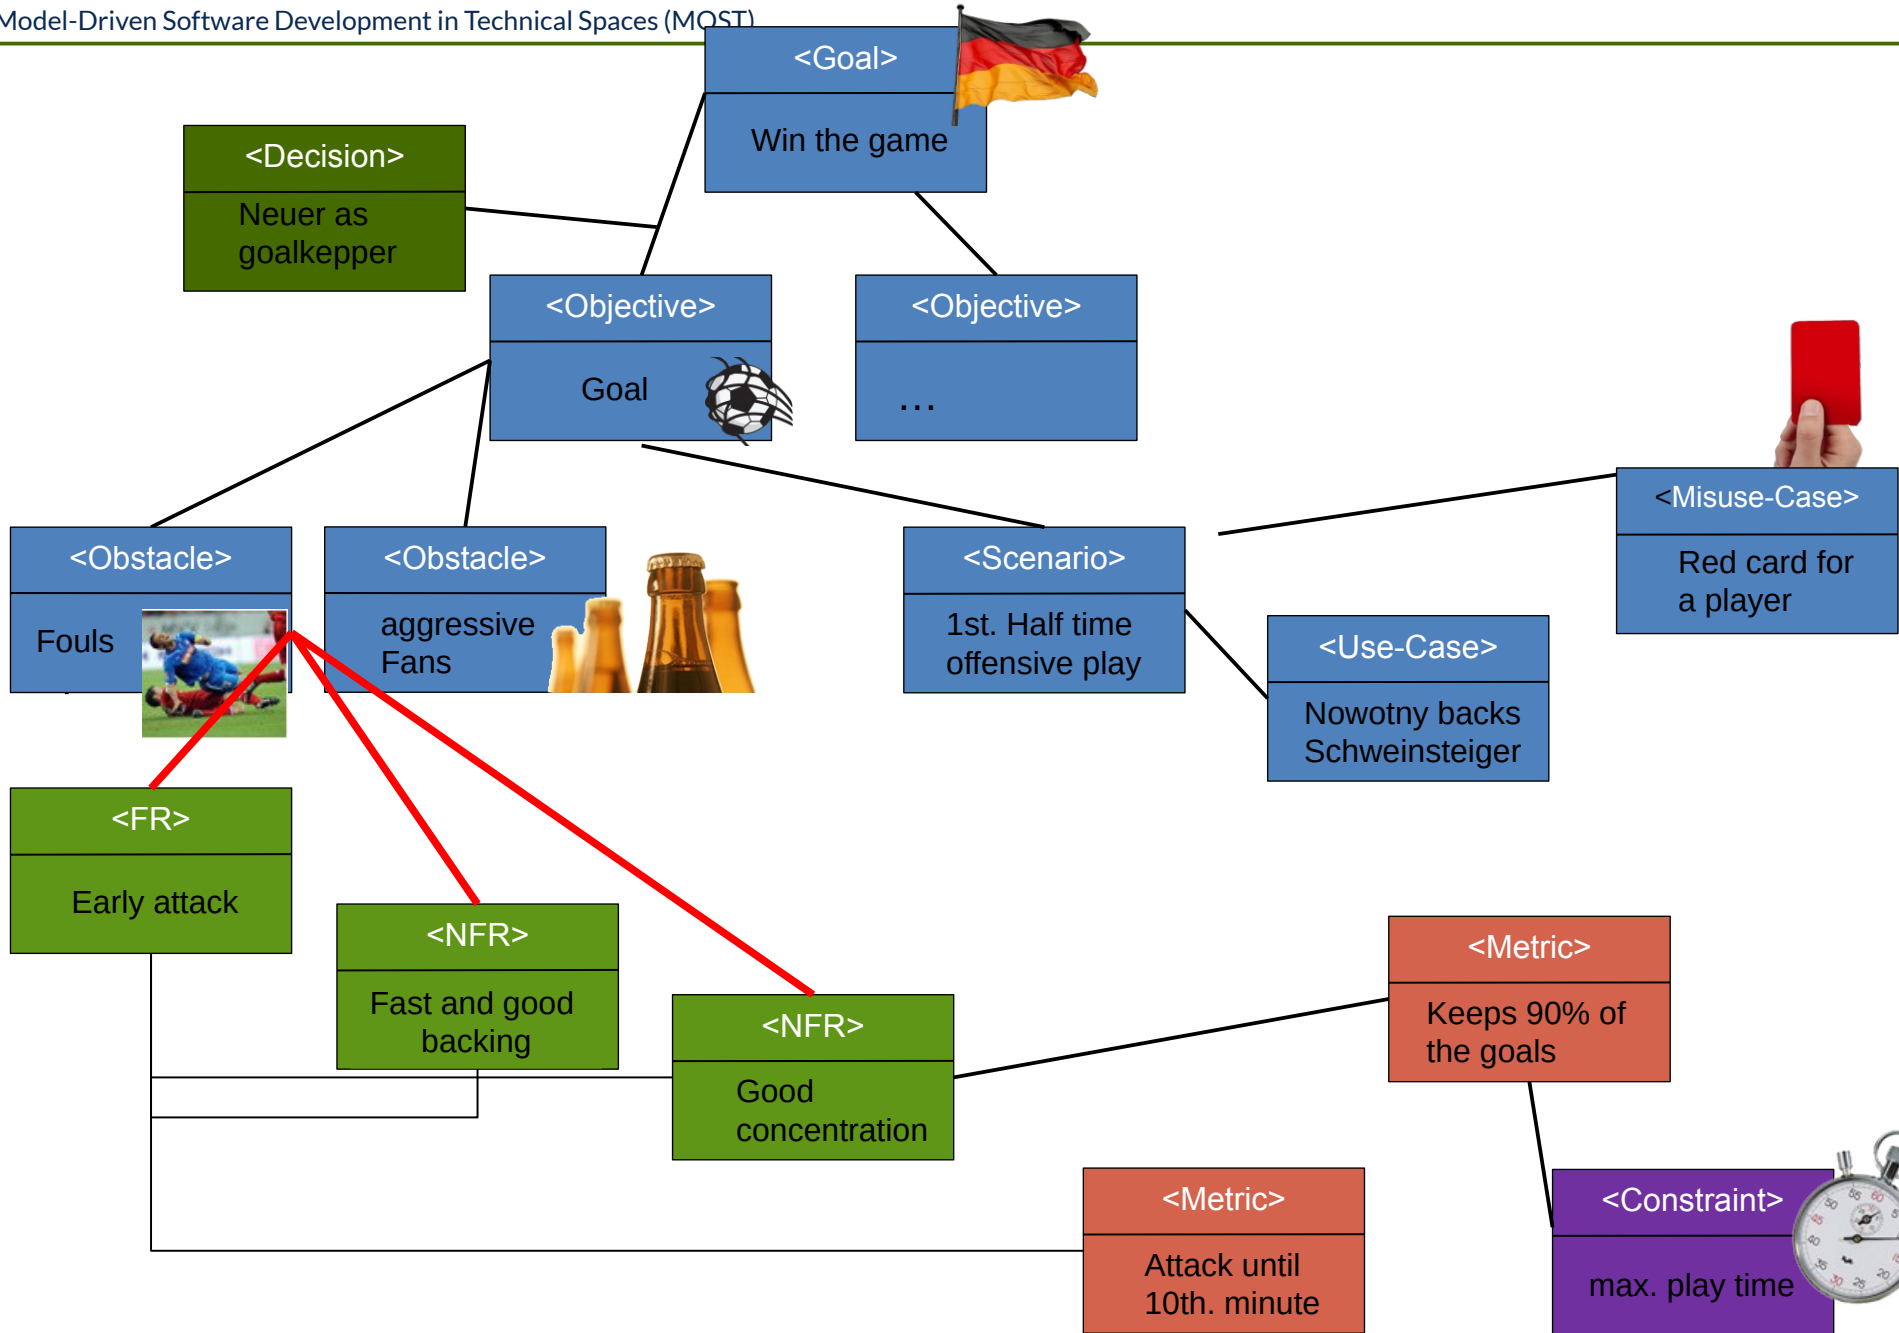

# Goal-Oriented RE (Motivation Example)

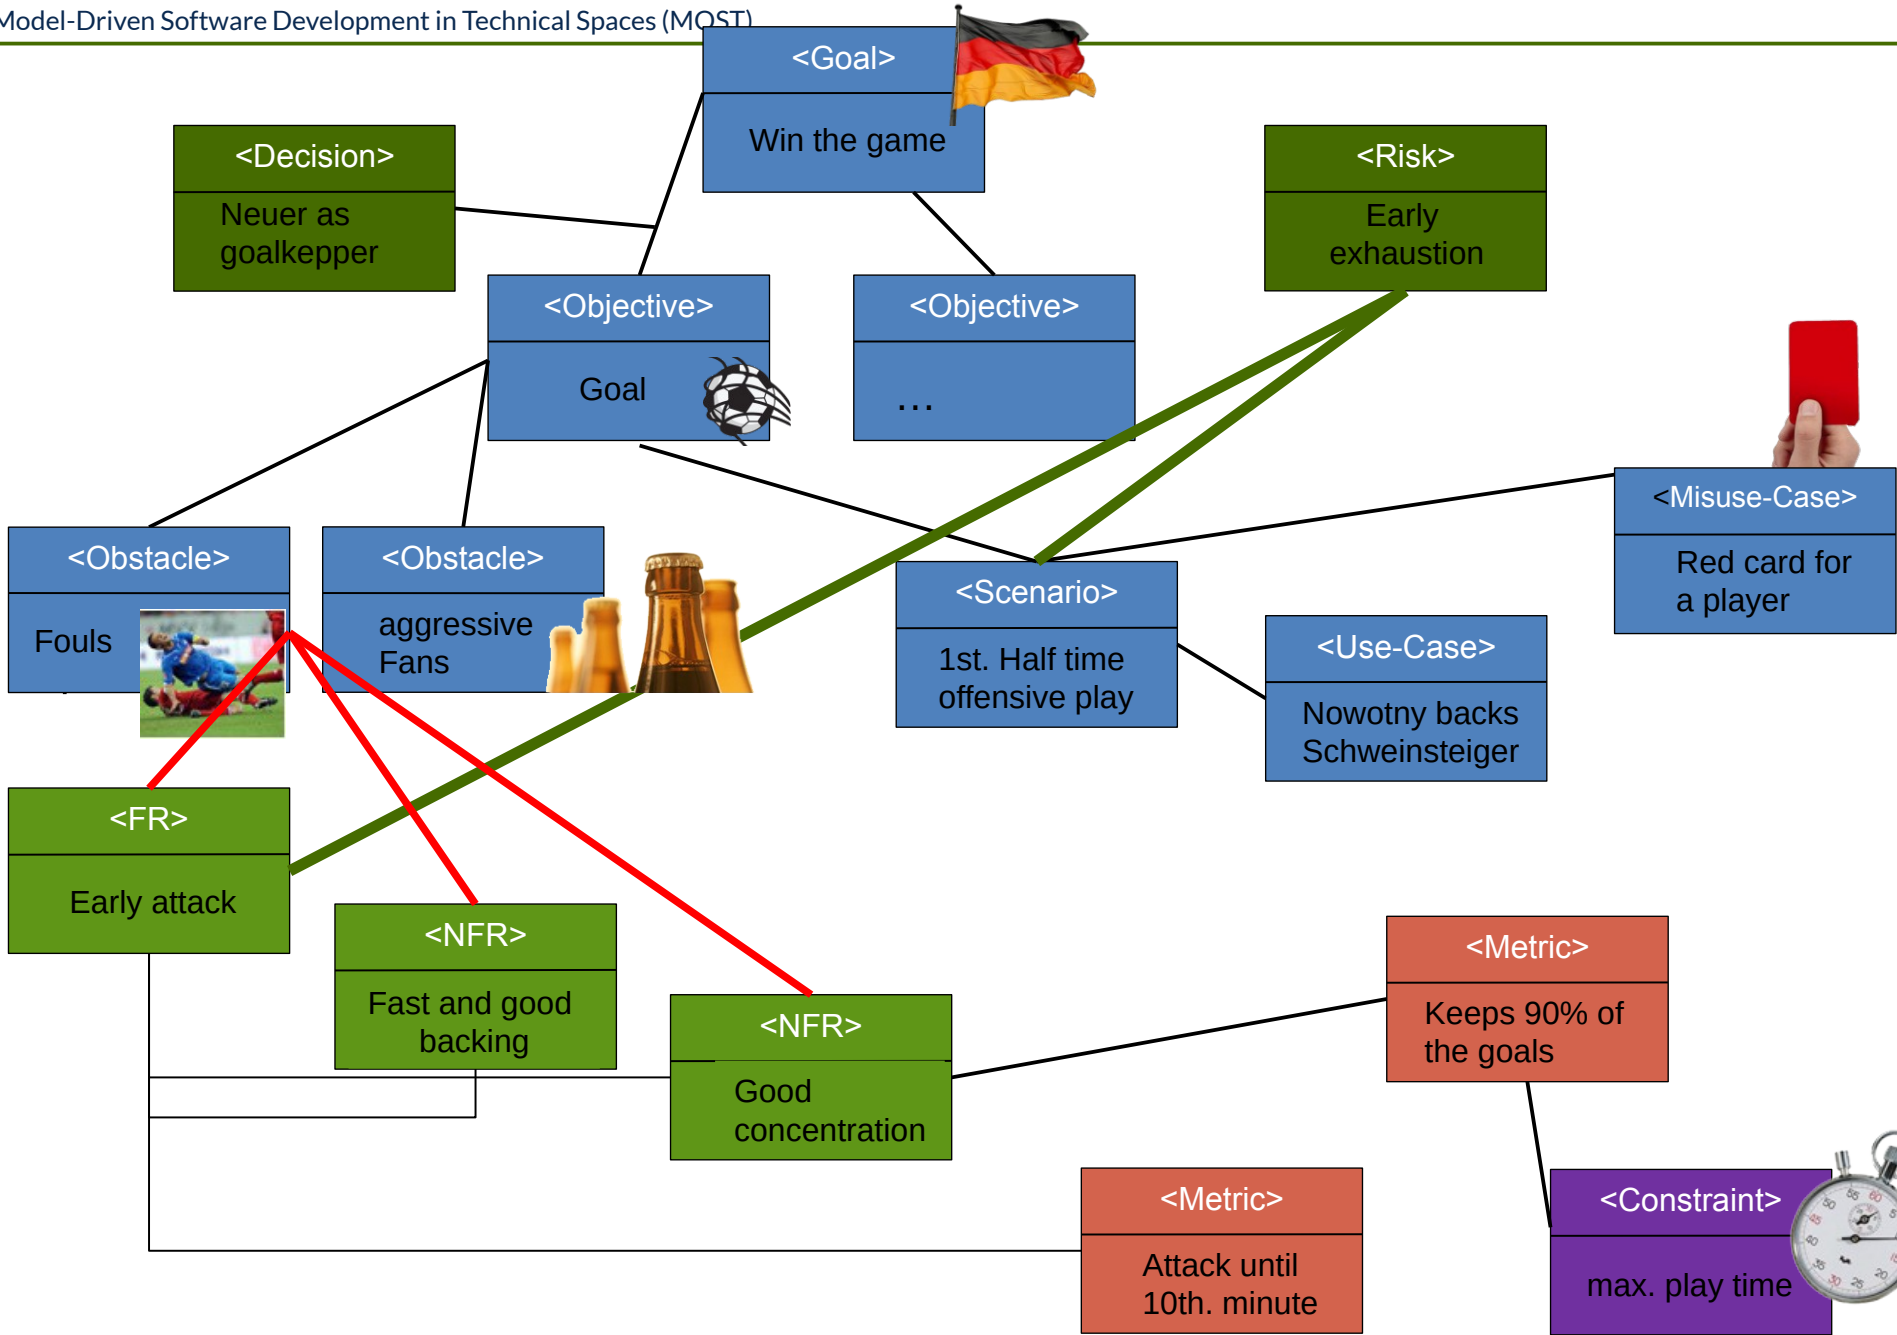

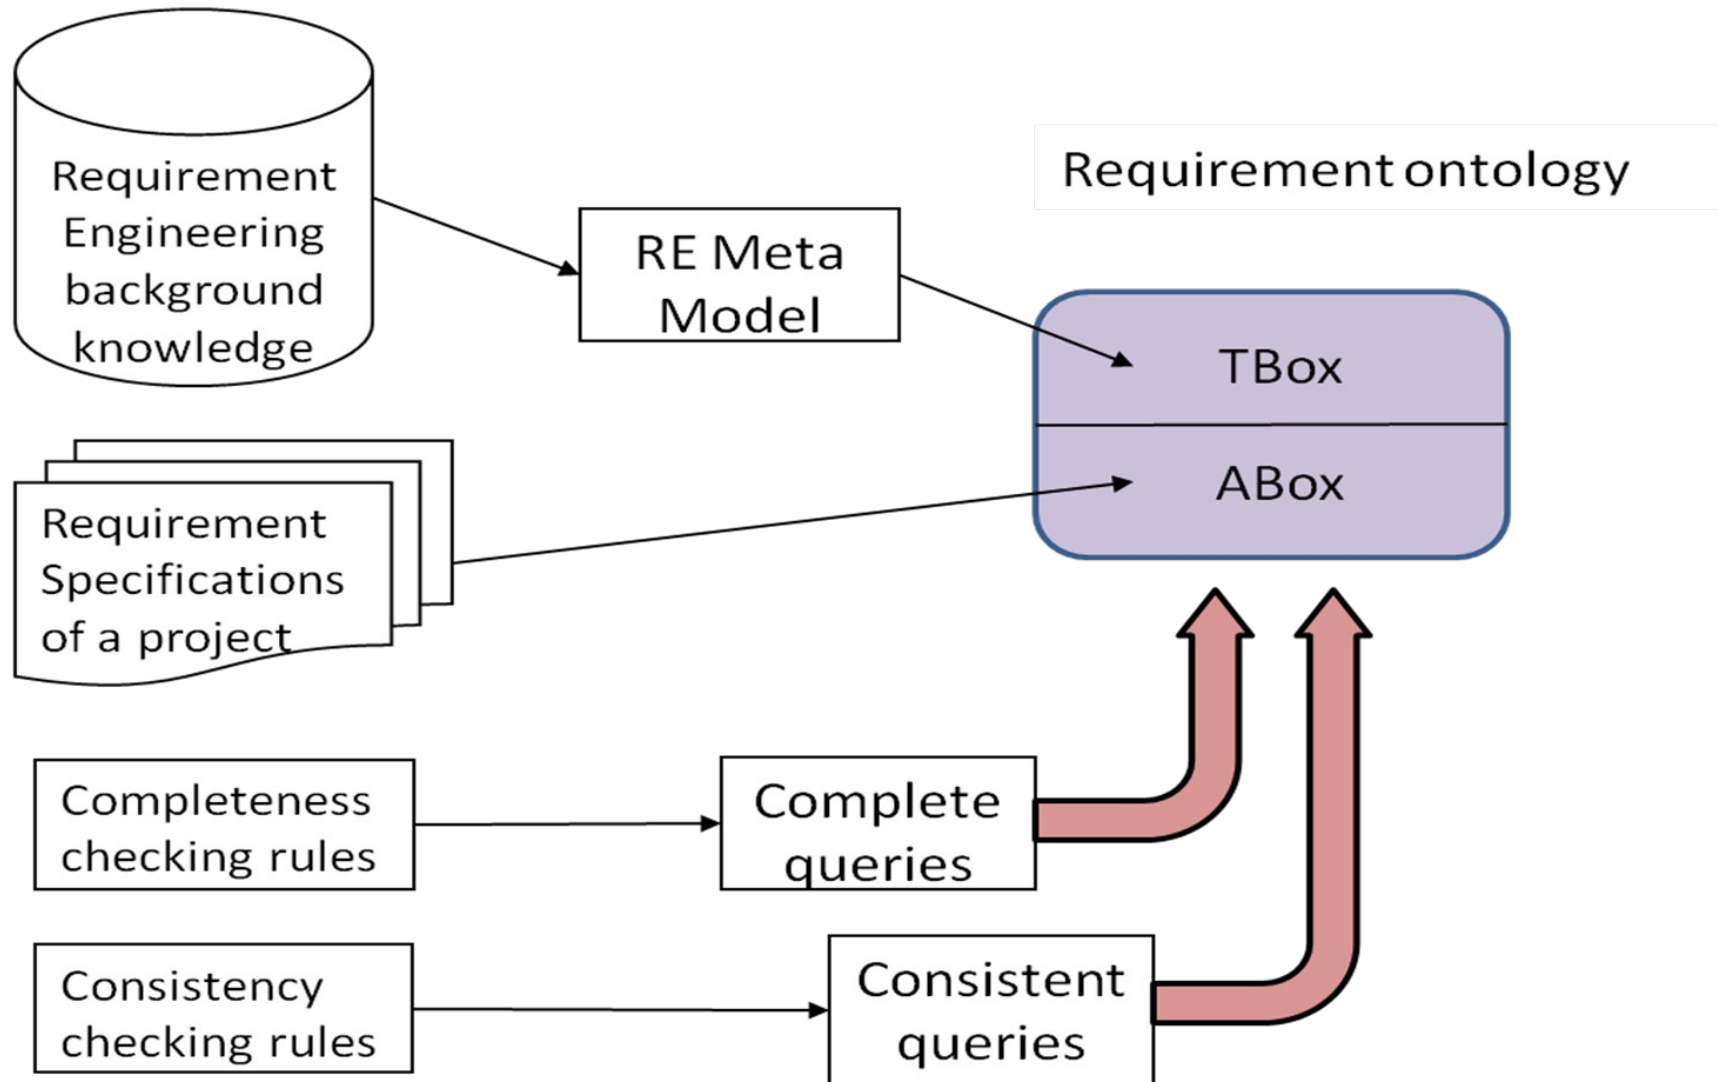

# Goal-Oriented RE (Motivation Example)

# Goal-Oriented RE (Motivation Example)

# Architecture for ODRE Tool

# Reasoning for RE – Completeness Check

▶ Example of Completeness Rule:

“Every Functional Requirement (FR) must define whether it is mandatory or optional. ”

- ▶ The GORE ontology of Lambsweerde needs about 50 completeness rules
- Implemented as SPARQL queries on the A-Box
  - The requirements model is deemed incomplete if a specific rule fails
  - Reasoning Strategy: Closed World Reasoning (for negation as failure)
    - supported by SPARQL 1.1 and TrOWL reasoner

# Reasoning for RE – Completeness Check (Example)

“Every Functional Requirement (FR) must define whether it is mandatory or optional. ”

- ▶ SPARQL rule:

```
IF FR is NOT mandatory AND NOT optional THEN  
  Print error: "You did not specify whether  
    the following FRs are mandatory or optional:  
    [FR_n]."  
  "Please specify whether these FRs are mandatory  
    or optional."
```

# Reasoning for RE – Completeness Check (Example)

- ▶ Extract of individuals and relationships of the A-Box from the SPARQL analysis :

*isRelatedTo(Goal2;UseCase7)*

*NonFunctionalRequirement (NonFunctionalRequirement1)*

*IsOptional(NonFunctionalRequirement1; true)*

*FunctionalRequirement(FunctionalRequirement1)*

## **Error.**

You did not specify whether the following FR are mandatory or optional:

*FunctionalRequirement1*. Please specify this attribute for the FR:

*FunctionalRequirement1*. Every FR must specify AT LEAST ONE requirement relationship.

# Reasoning for RE – Consistency Check

- ▶ GORE needs 6 consistency rules among requirement artefacts (valid relations between requirement artefacts)
  - Based on a chosen subset of requirement artefacts
  - Consistency rules are encoded as DL axioms in the A-Box
- ▶ Instance specific error messages resulting from validation displayed by Guidance Engine

# Reasoning for RE – Consistency Check (Example)

59

Model-Driven Software Development in Technical Spaces (MOST)

- ▶ Extract of individuals and relationships of the A-Box from the SPARQL analysis :

*isExclusionOf*(*FunctionalRequirement5*; *FunctionalRequirement7*)

*ChosenRequirement*(*FunctionalRequirement5*)

*ChosenRequirement*(*FunctionalRequirement7*)

## **Error.**

The following requirements exclude others:

*FunctionalRequirement5*.

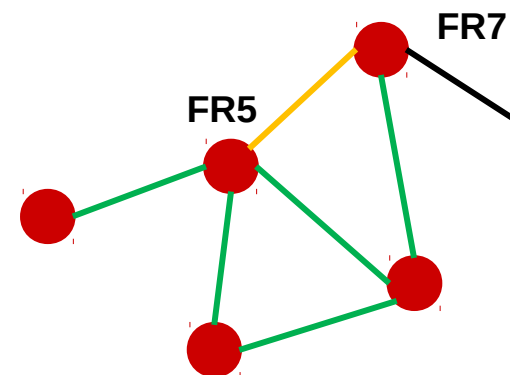

Please choose one of the following options:

## **Suggestion.**

Exclude the following requirements from the chosen requirement set: *FunctionalRequirement5*. **OR**

Find alternatives for: *FunctionalRequirement5* or

Revise the requirement relationships of(*FunctionalRequirement5*, *FunctionalRequirement7*).

# Reasoning for RE – Verification Methods (Example)

## ► Consistency check of requirement selection (6 rules)

Excluding requirements must not be included in one set.

```
IF excluding requirements are included in one set  
THEN print error: "The following requirements exclude  
  Others: [R_n]."
```

```
"Please choose one of the following options:
```

```
Exclude the following requirements: [R_n],
```

```
Find alternatives for [R_n] or
```

```
Revise the requirement relationships of [[R x, R y], ... ]."
```

- ▶ All Requirement artefacts and meaningful relationships can be captured within an Ontology Metamodel
- ▶ ODRE Approach detects **inconsistent** and **incomplete** requirements
- ▶ Standard tooling (reasoners) are useful
  - Specification of requirements uses OWA
  - Verification needs CWA
- ▶ First evaluation proves applicability for medium requirement specifications
  - Problem: available requirement specifications do not provide sufficient information (much less than could be captured by ODRE)
  - Primary evaluation within MOST Project
    - Capture all requirement artefacts
    - Detect all inconsistencies and incomplete metadata
  - PhD Thesis of Katja Siegemund (2014)

# The End
