Version 21-1.2, 08.01.22

- 1) Parsing
- 2) Regular Tree Grammars
- 3) Tree Construction
- 4) Text Algebrae
- 5) Controlled Natural Languages (CNL)
- 6) Pseudocode and Markup Languages

Literature

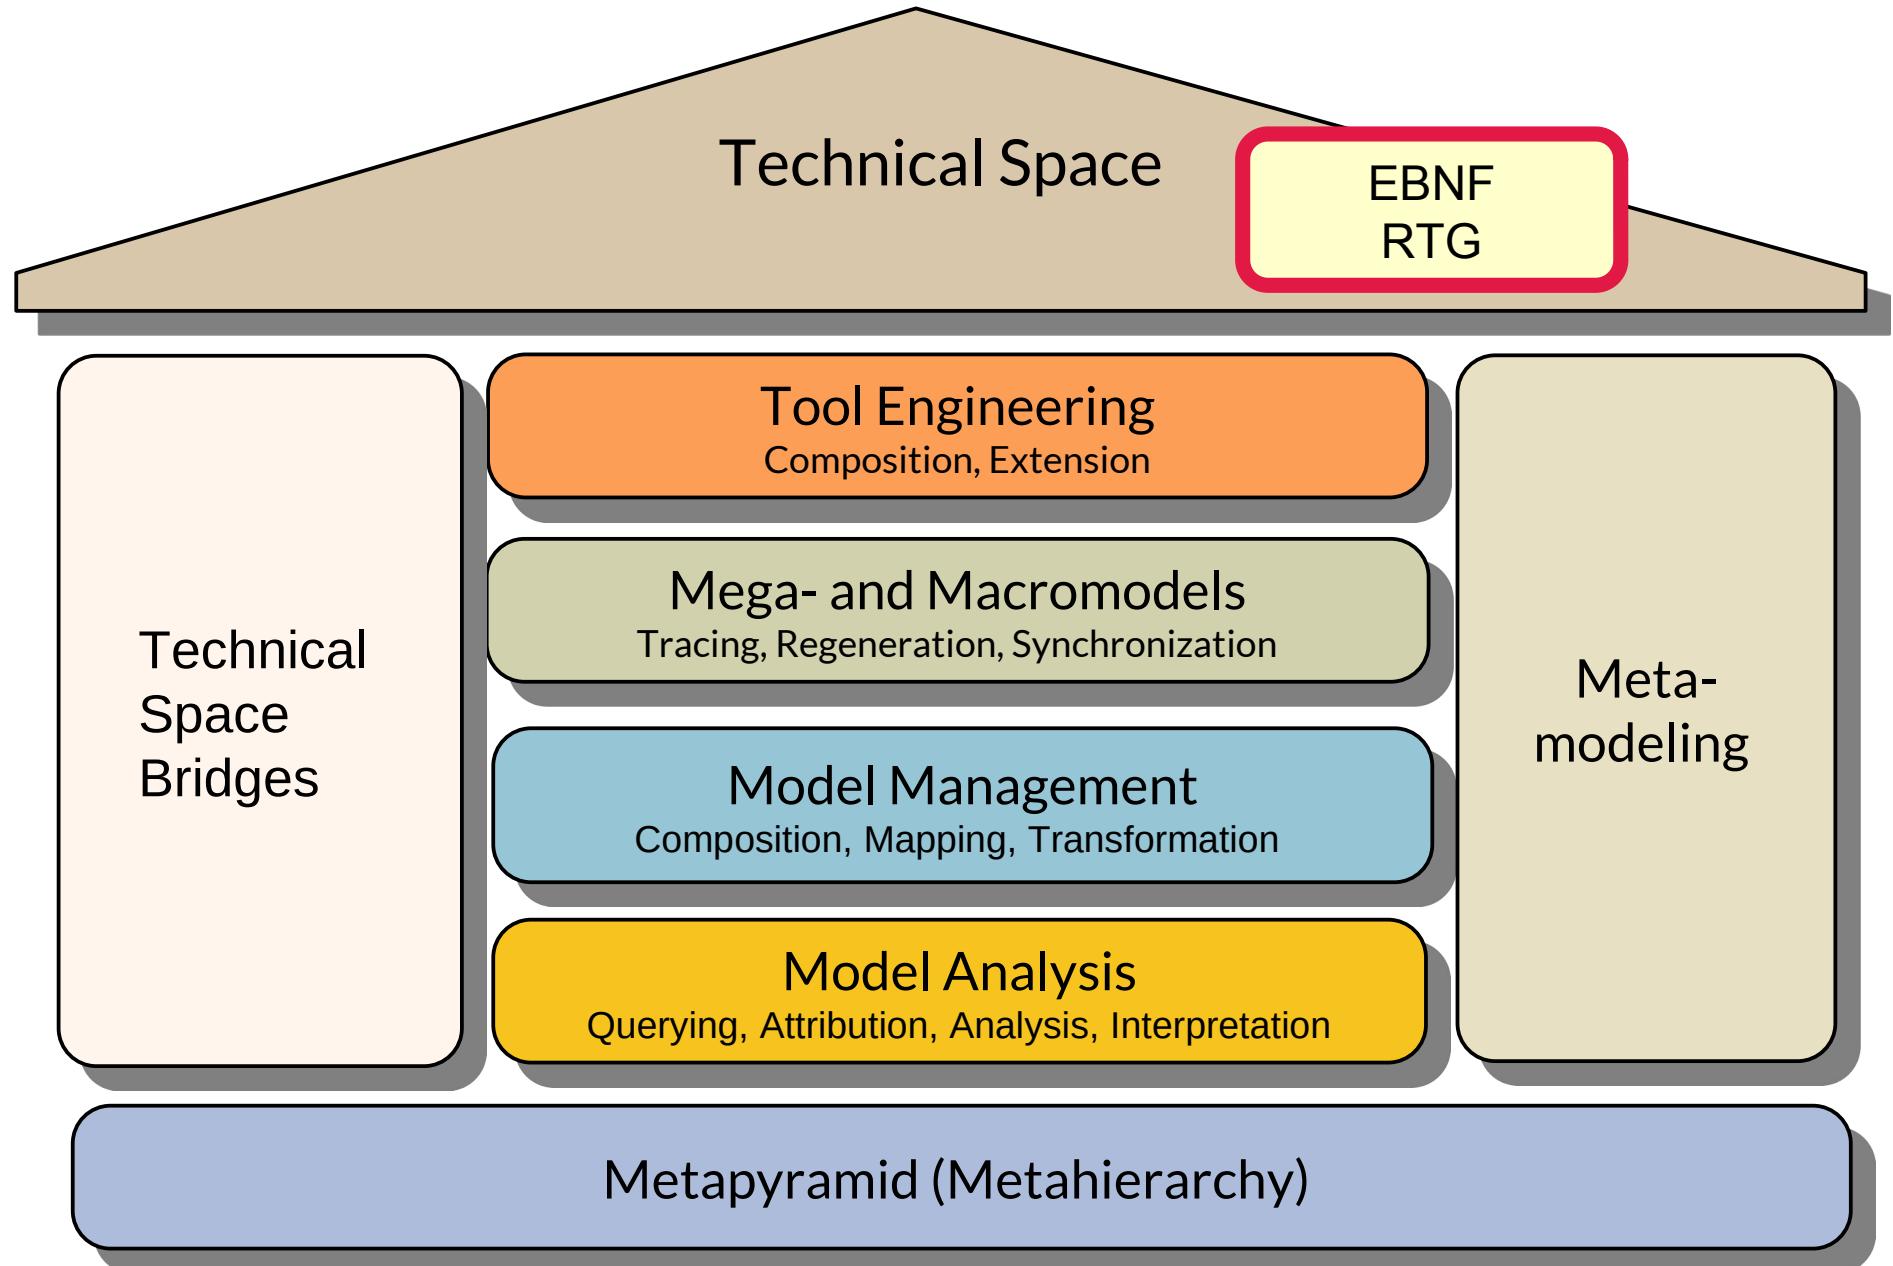

- ▶ Obligatory:
 - <http://www.antlr.org>
- ▶ Optional:
 - Cocktail www.cocolab.de, die Compiler-Toolbox für die schnellsten Compiler der Welt (kommerziell, Demoversionen erhältlich)
 - TaTa Tree Grammars <http://tata.gforge.inria.fr/> and all the tree theory
 - Oana Andrei, Helene Kirchner. A Port Graph Calculus for Autonomic Computing and Invariant Verification. A. Corradini. TERMGRAPH 2009, 5th International Workshop on Computing with Terms and Graphs, Satellite Event of ETAPS 2009, Mar 2009, York, United Kingdom. Electronic Notes in Theoretical Computer Science, Elsevier. Preprint <inria-00418560>, <https://hal.inria.fr/inria-00418560>

20.1. Parser Generators in the Technical Space Grammarware

- 1) Parsing as checker for instance-of
 - 2) Antlr as example
 - 3) Example pocket computer
- Analyzing the structure of linear lists
 - And transforming them to trees

Q10: The House of a Technical Space

Q11: Overview of Technical Spaces in the Classical Metahierarchy

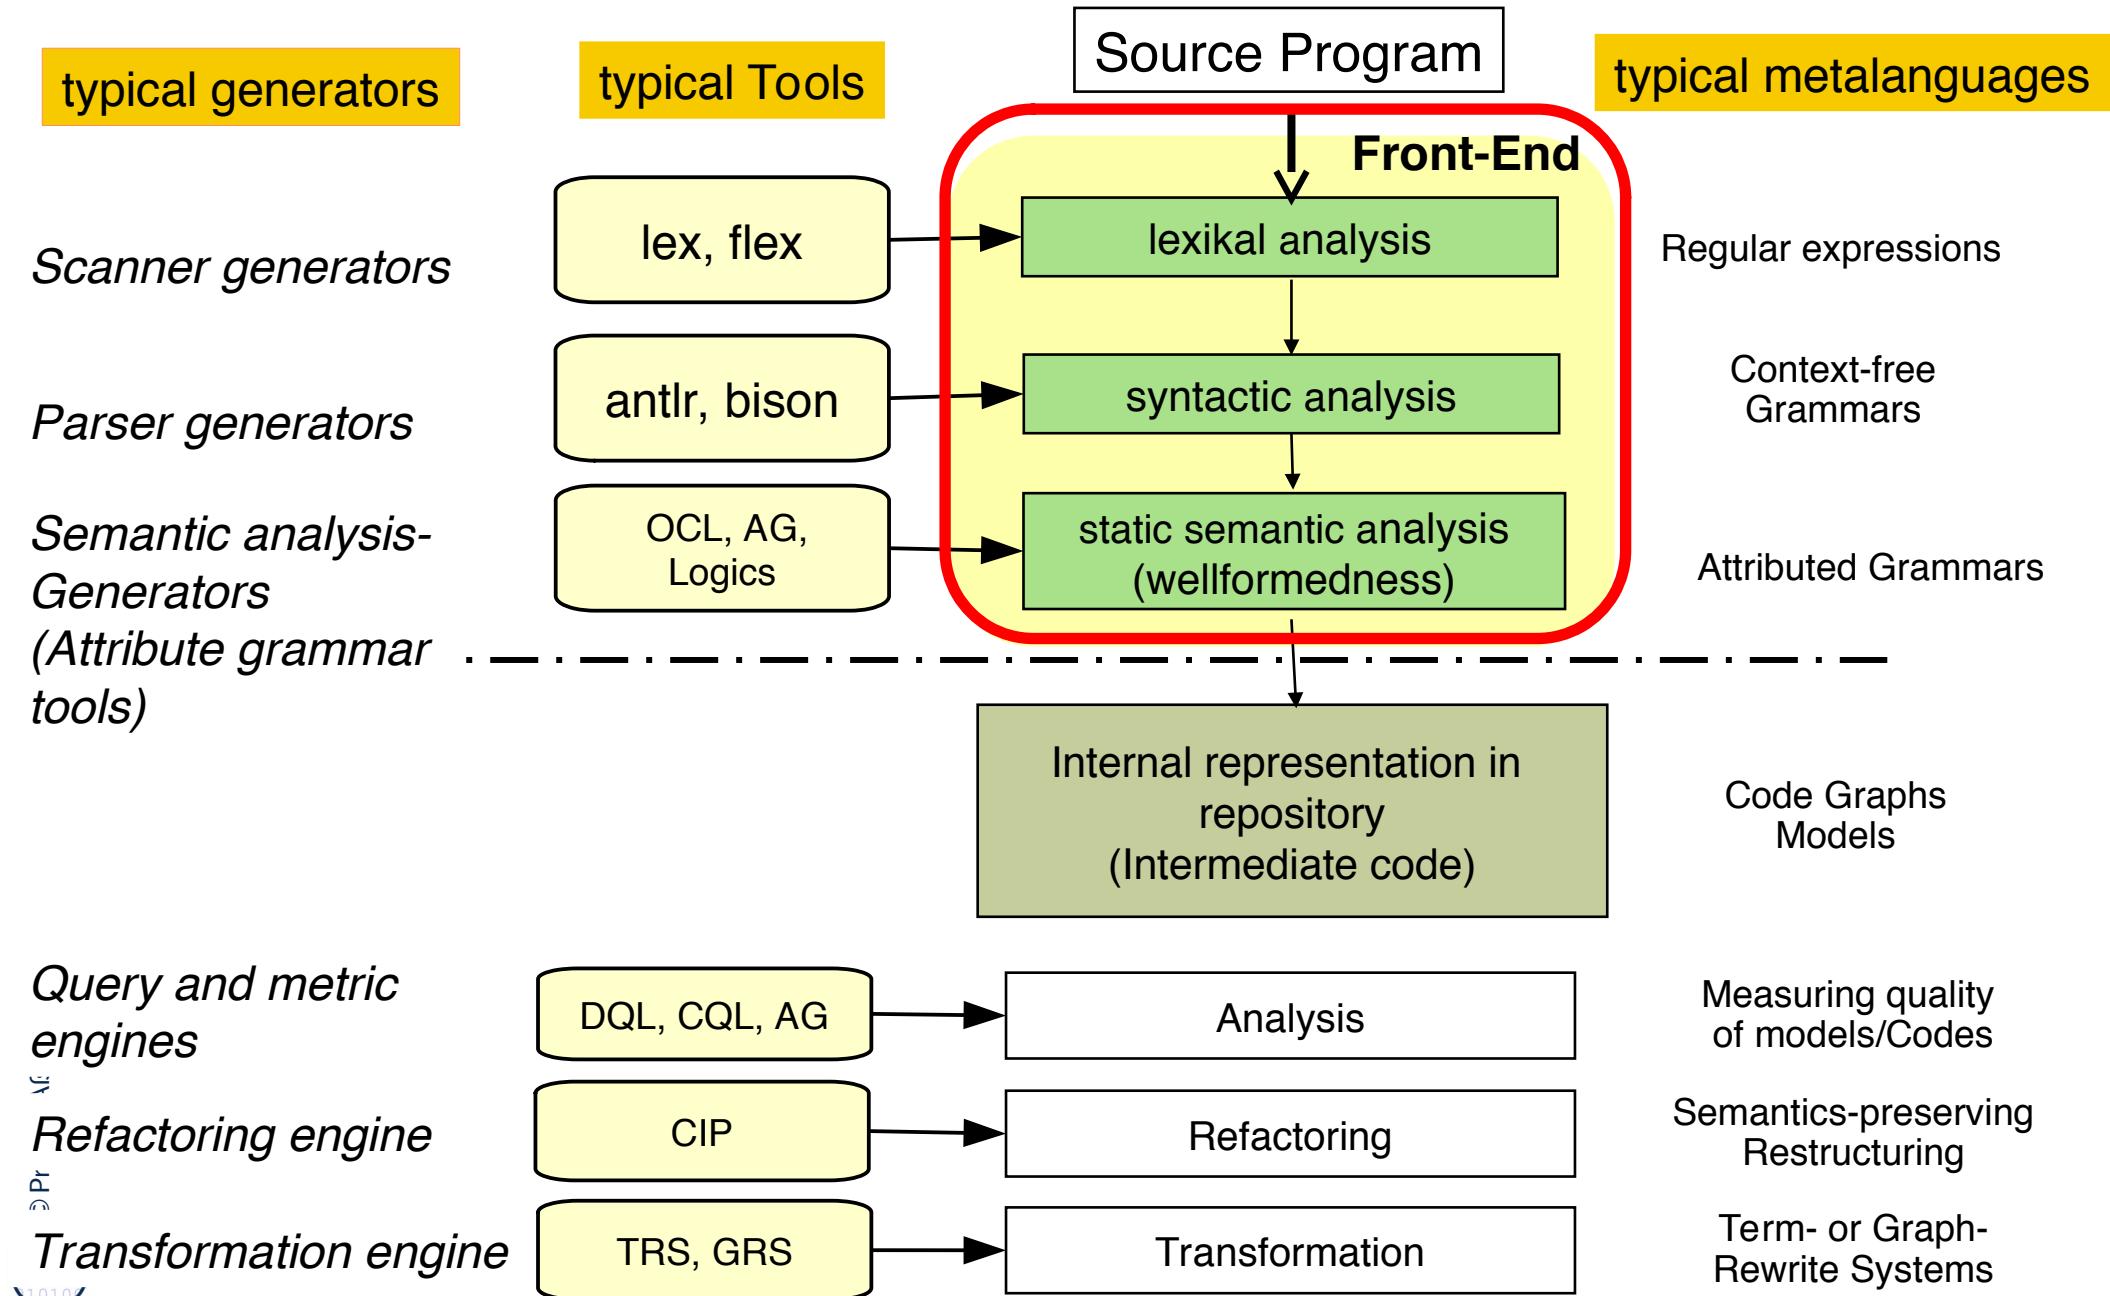

5 Model-Driven Software Development in Technical Spaces (MOST)

	Gramm arware (String s)	Text-ware	Table-ware		Treewar e (trees)	Link-Tree-ware		Graph ware/ Model ware			Role-Ware	CROM-Ware	Ontology-ware
	Strings	Text	Text-Table	Relational Algebra	NF2	XML	Link trees	MOF	Eclipse	CDI F	MetaEdit+	Context-role graphs	OWL-Ware

Q7: Phases of a Source Code Importers into a Repository and the Generating Tools

6

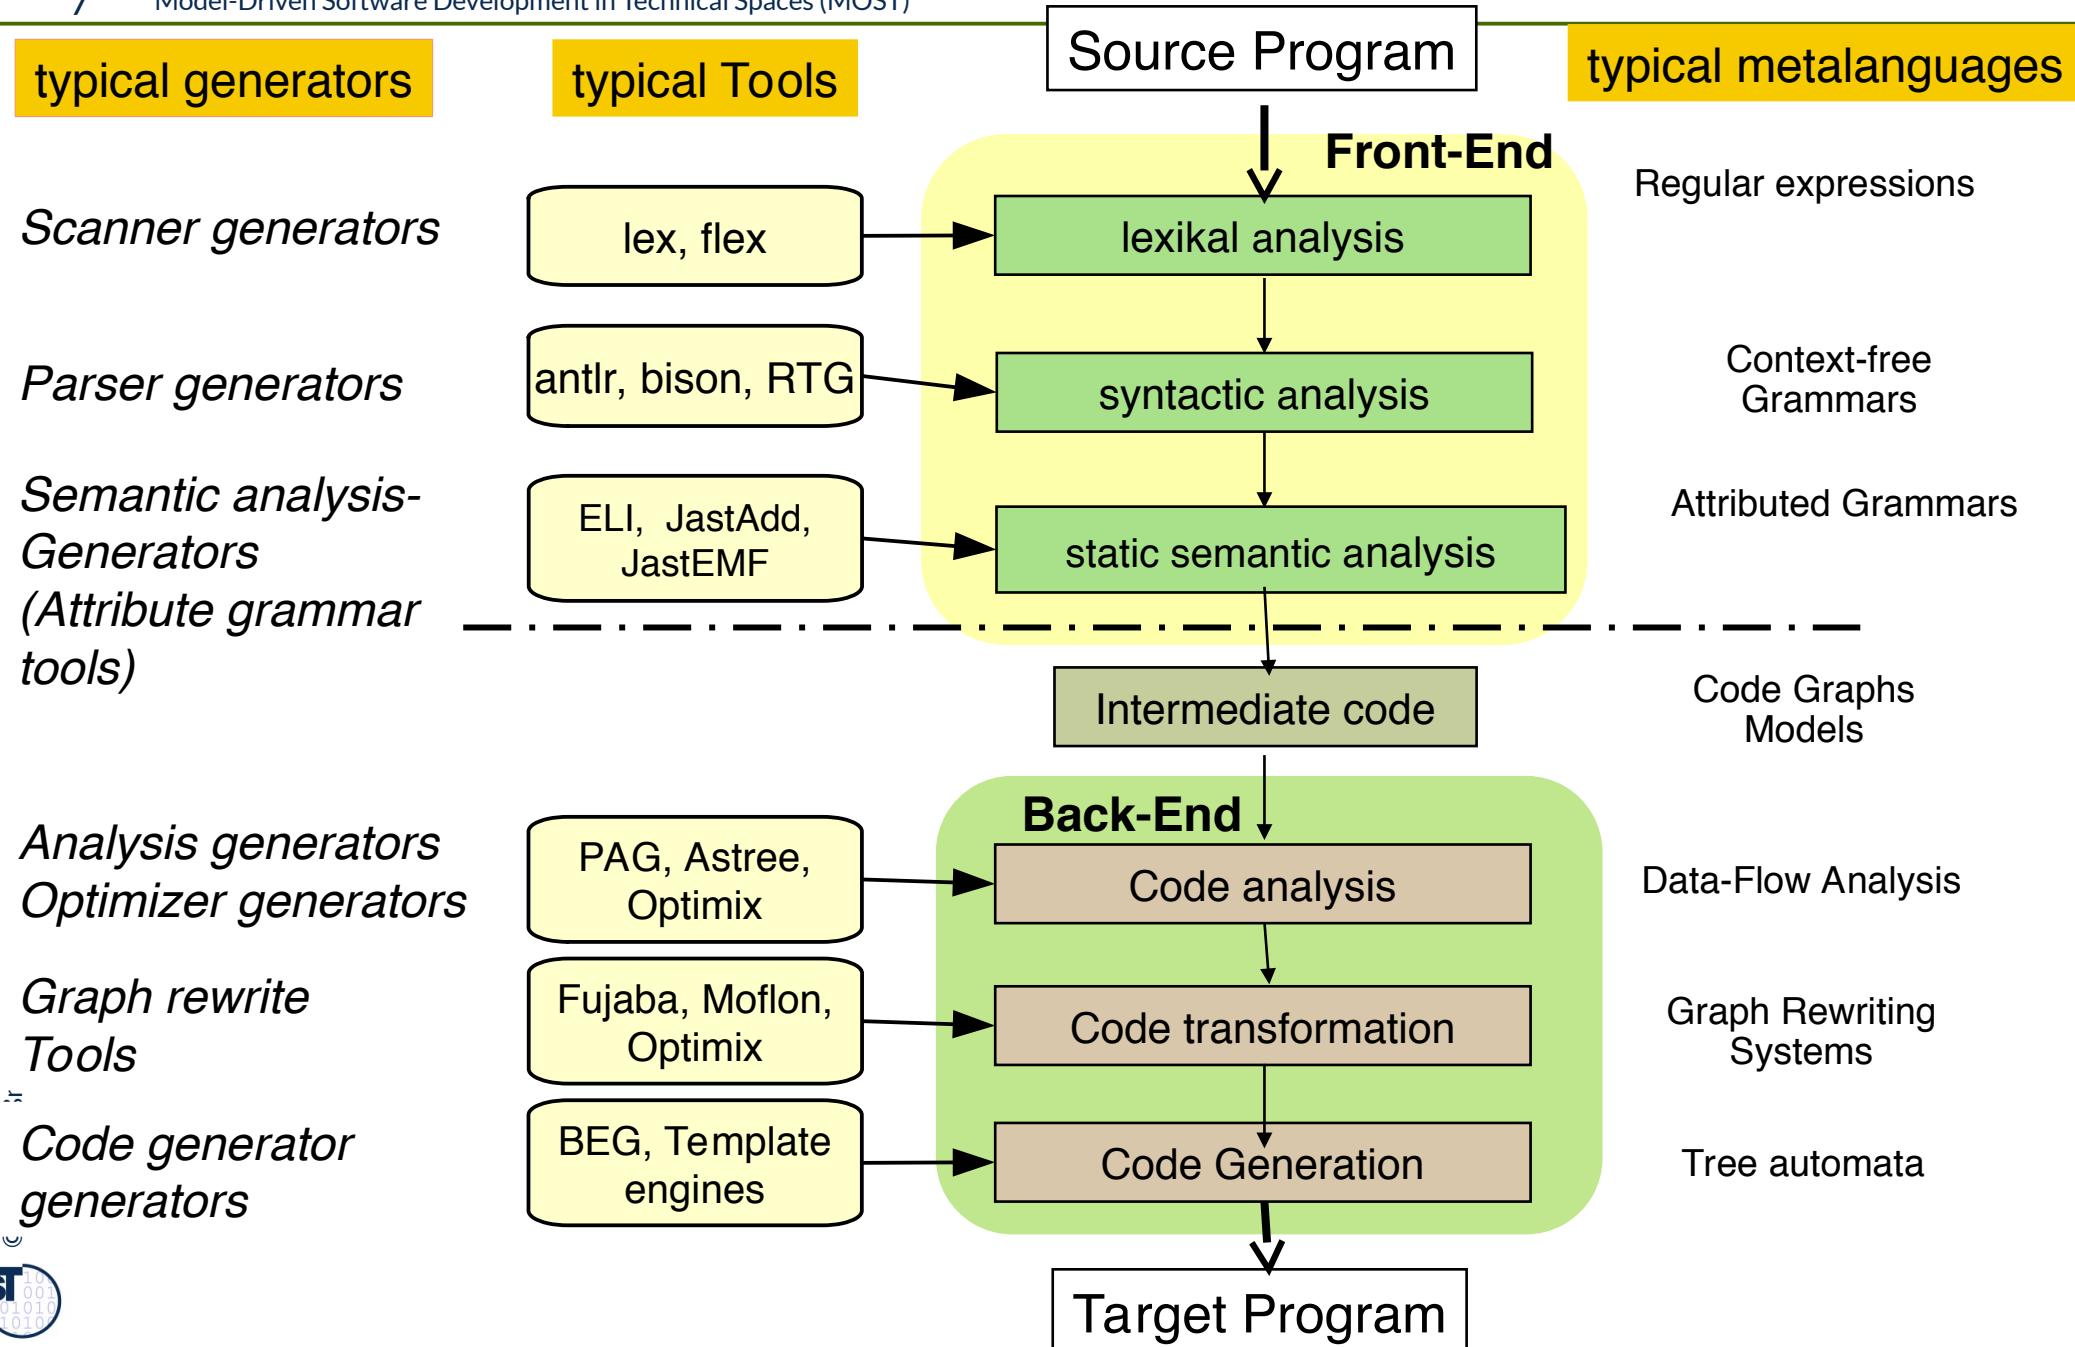

Model-Driven Software Development in Technical Spaces (MOST)

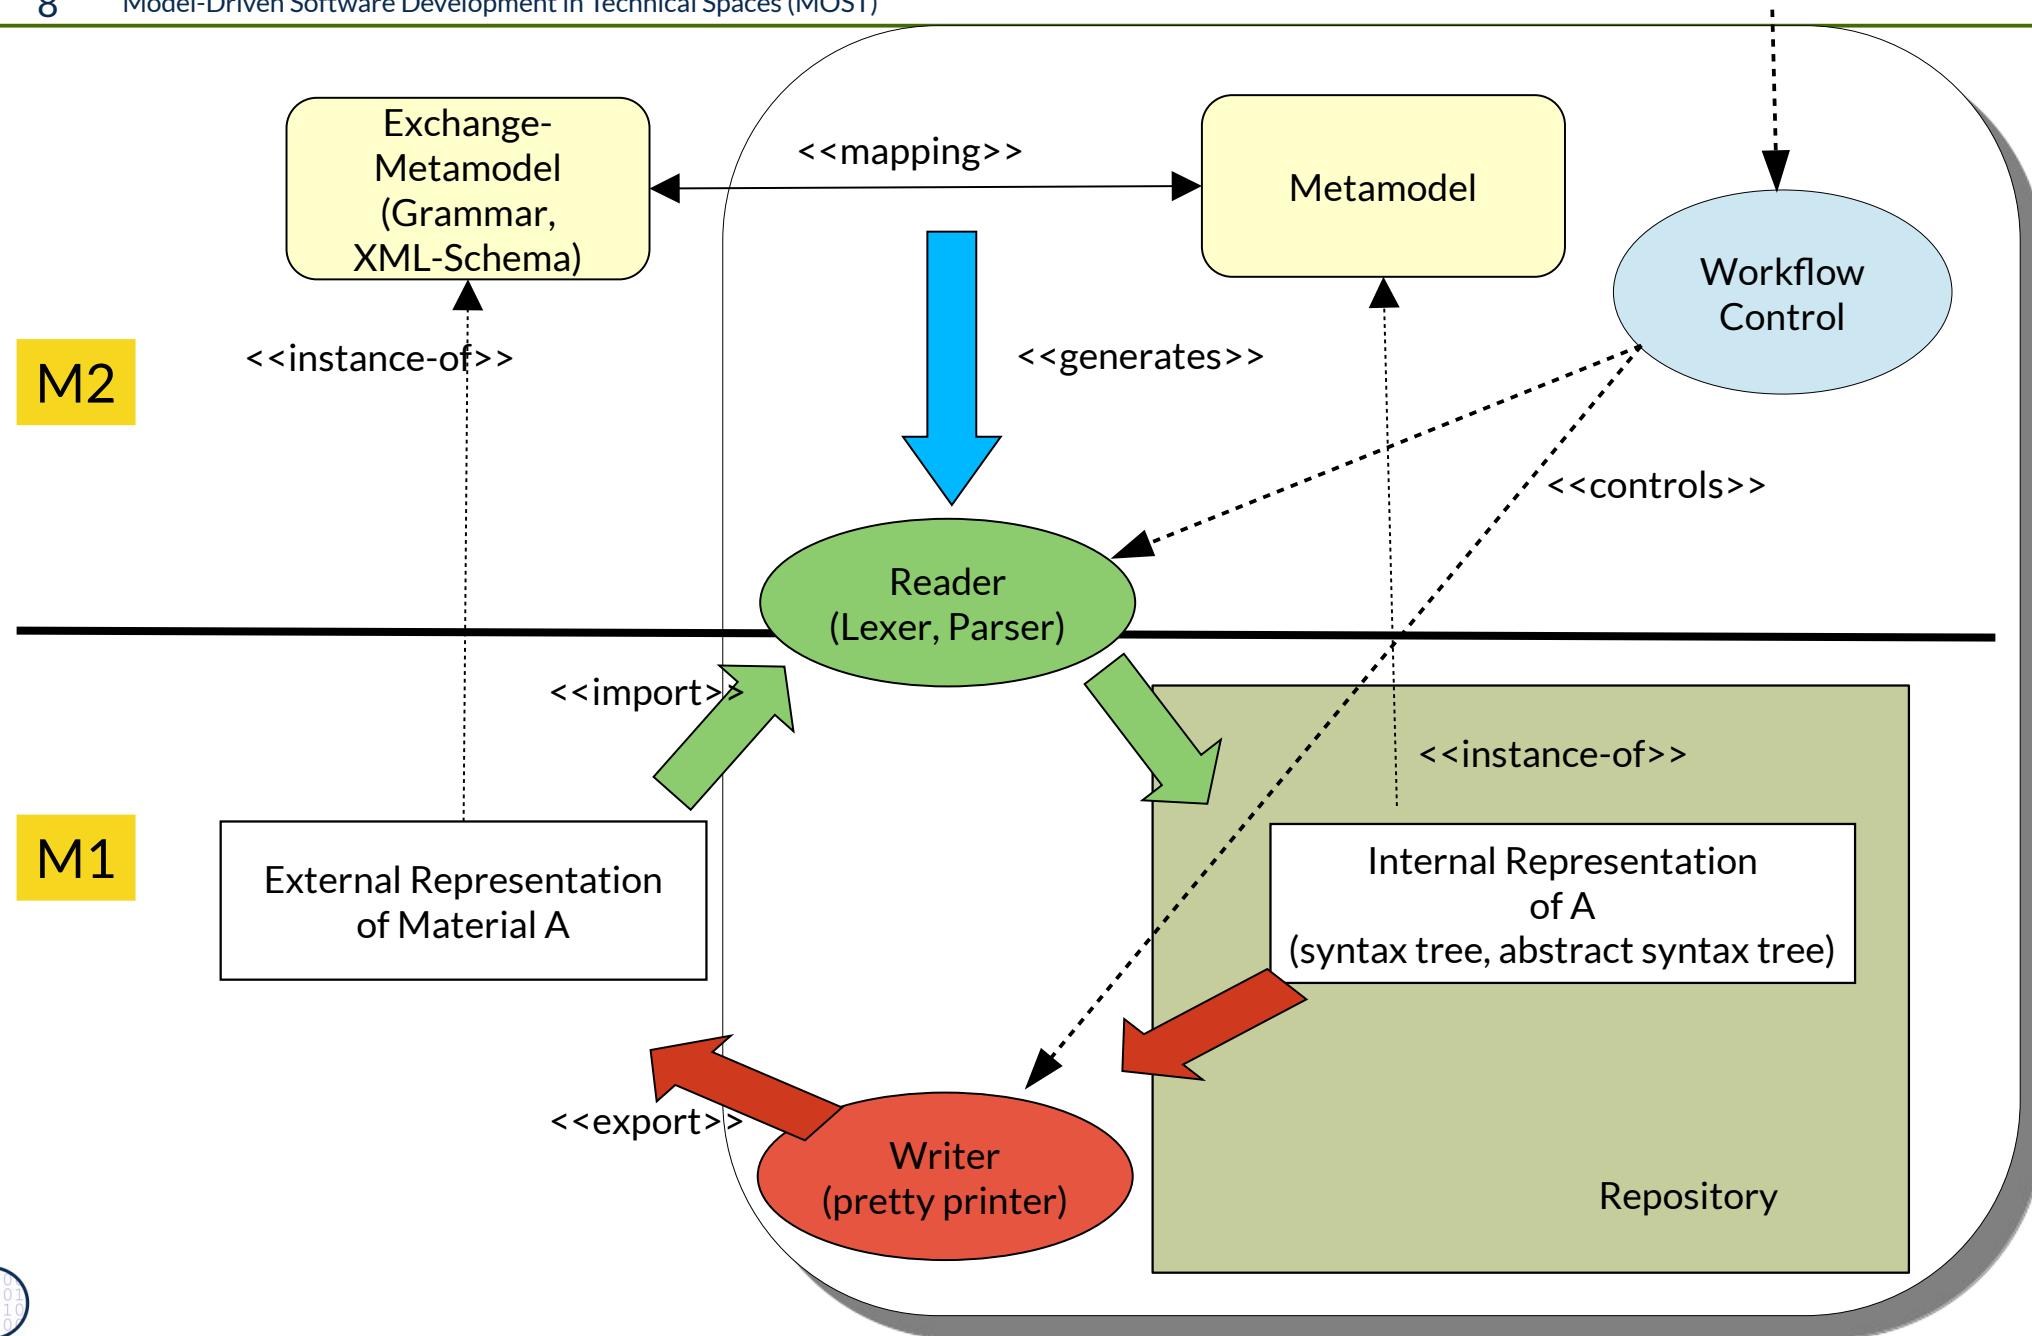

Q9: Phases of Compilers and Software Tools and Generators

7

Model-Driven Software Development in Technical Spaces (MOST)

Rpt.: Use of Generated Importers and Exporters in Modelling Tools

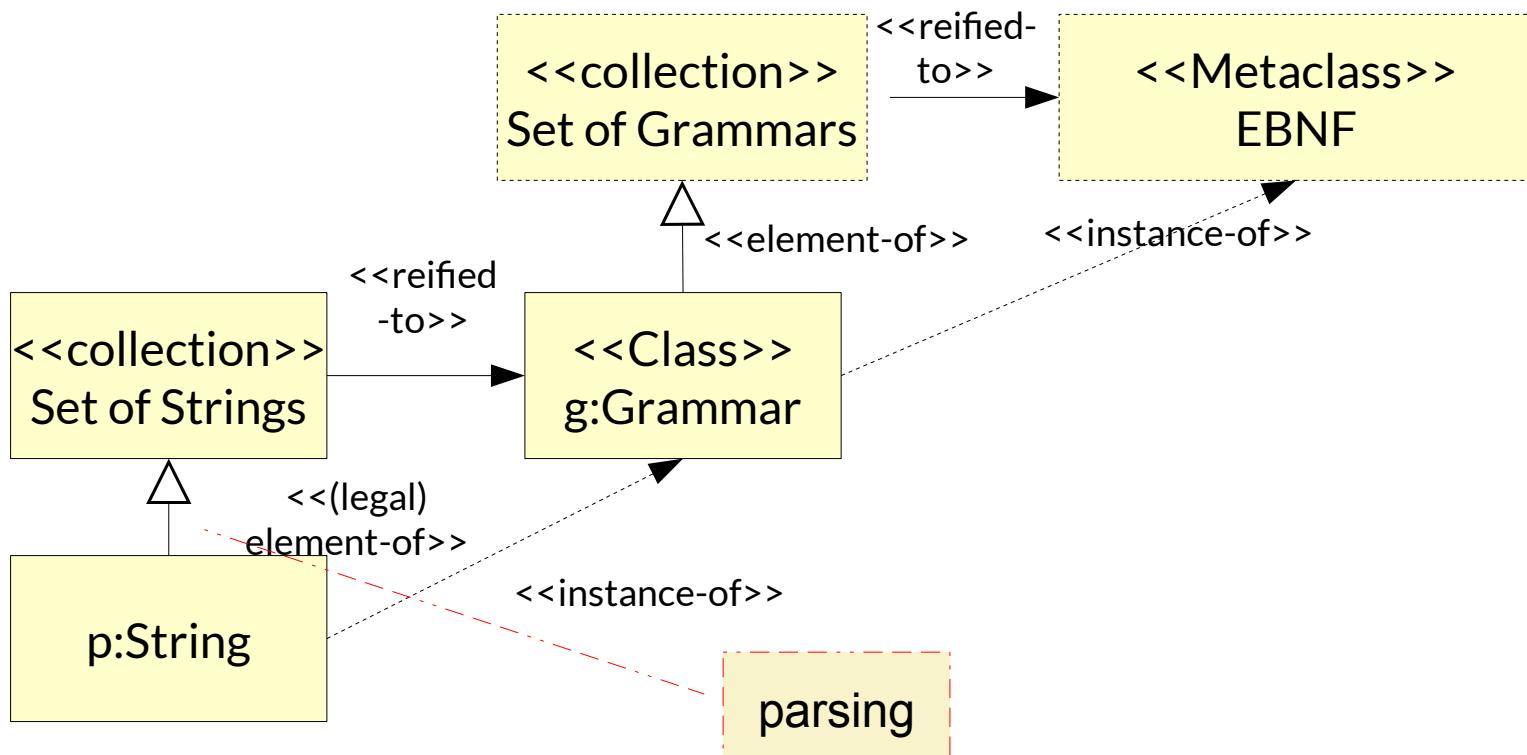

Problem 1 of Parsing

- ▶ Parsing a program, model or document, or a material means to **recognize its context-free structure in the linear stream of characters**
 - Parsers are usually the first phases of a tool when it *imports a material*
- ▶ Parsers parse according to the *concrete syntax grammar* containing
 - Whitespace handling
 - Block handling (brackets)
 - Comment handling
- ▶ From a context-free grammar, a **parse automaton with parse rules** can be derived:
 - Address ::= Streetname StreetNumber Location
 - Location ::= Postcode Town Country
- ▶ Generates the parse rules
 - Streetname StreetNumber Location → Address
 - Postcode Town Country → Location
- ▶ The parser reads in all tokens until it can decide which rule to reduce

String/Text Parsing with Grammars

- ▶ A grammar can be used to generate a parser for strings (texts) that tests the legality of a string with the grammar
- ▶ The parser checks <<instance-of>> for the string p with regard to the grammar g

M3

EBNF Rules for String Grammars

Symbol	Meaning	Example
Name (Nonterminal)	Identifier (for type or variable)	A = B + C
"text"	Token (text terminal)	B ::= "Town" + R
=, ::=	Consists of	X ::= X1 + X2 + X3
+, also juxtaposition	Sequence	X ::= X1 X2 X3
@	Key (unique identifier)	P = @PersonNr + N + Address
[... ...]	Selection (alternative)	P = [P1 P2]
n { ... } m	Iteration, at least n upto m times	B = 1 { C } 10
n *	Iteration of n - arbitrarily many times	Children ::= Name *
n +	Iteration of n at least once	PastEmployers ::= Name +
(...)	Optional	Address ::= Street + (PostBox)
A // ","	Sequence of A with intermittend ", "	C = D // ","
* ... *	Comment	X = B + C *text*
< a > b	Modifier (Kommentar)	< old > A < new > A
SYN	Synonym für Name	SecondName SYN SurName

Example: Address Grammar

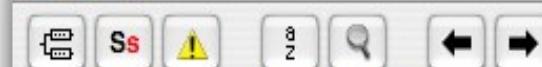

- ▶ “::=” means “is-composed-of” or “is-decomposed-to”
 - ▶ Every rule declares a whole-part decomposition
 - ▶ Grammar declares the structure of a part list

```
Address      ::= Person Company Location.  
Person       ::= Title Name  
Title        ::= „Dr.“ | „Prof. Dr.“ | „Mr.“ | „Ms.“  
Name         ::= FirstName* LastName  
Company      ::= String  
Location     ::= Street StreetNumber Postcode Town  
FirstName    ::= String  
LastName     ::= String  
Postcode     ::= 5{Digit}5  
Street       ::= String  
StreetNumber ::= Integer [ String ]  
Town         ::= String
```

Example: ANTLR www.antlr.org

- ▶ Since the 90s, many parser generators have been built for C/C++
 - Cocktail's lalr, ell, lark www.cocolab.de
 - Fnc2 (INRIA)
 - flex und bison (GNU)
 - Eli is a fast compiler generator toolset <http://eli.sfl.net>
- ▶ For Java, ANTLR is popular
 - Parser class LL(k): Left-recursive grammar rules, k-lookahead for decisions
 - Generated Parser with algorithm “recursive descent”
 - http://www.bearcave.com/software/antlr/antlr_expr.html

20.1.2 Program Interpretation While Parsing

An ANTLR Grammar for the Input Language of Pocket Calculator

- ▶ ANTLR knows several *actions* (*snippets*, *fragments*) in a rule
 - *semantic actions*: modifying attributes of nodes or temporary values
 - *emissions*: emitting tokens of an output alphabet, e.g., for code generation
 - *motions*: emitting an action on a shared environment (“motion grammars”)
 - e.g., for controlling a robot
 - Motion grammars usually influence parsing also!

Actions Calculating Attributes

21

Model-Driven Software Development in Technical Spaces (MOST)

- ▶ Pocket calculator interpretes the program to calculate one attribute \$value
 - Interpretation needs non-terminal attributes, which are stored on the stack of the parser
- ▶ Usually, the parse automaton with the parse rules is not shown, because it is rather complex
- ▶ Debugging a generated parser is no fun

```
grammar Expr;
@header {
package test;
import java.util.HashMap;
}
@lexer::header {package test;}
@members {
/** Map variable name to Integer object holding value */
HashMap memory = new HashMap();
}
prog: stat+ ;

stat: expr NEWLINE {System.out.println($expr.value);}
| ID '=' expr NEWLINE
{memory.put($ID.text, new Integer($expr.value));}
| NEWLINE
;
expr returns [int value]
: e=multExpr {$value = $e.value;}
( '+' e=multExpr {$value += $e.value;}

```

Applications of String Grammars

Applications can be everything that has to do with *ordered strings*:

- ▶ Protocol checking in component-based systems (protocol automata and grammars)
- ▶ Document processing
- ▶ Matching text patterns and data mining in files, emails, streams
- ▶ Communication in multi-agent systems

20.2 Regular Tree Grammars (RTG)

- String grammars are for structuring sequences
- RTG are for specifying trees, syntax trees and abstract syntax trees
- A RTG does not care about concrete syntax

Regular Tree Grammars

29

Model-Driven Software Development in Technical Spaces (MOST)

- ▶ String Grammars assume:
 - Sequence of words
 - Implicit syntax tree, because non-terminals specify it implicitly
- ▶ **Regular Tree Grammars** specify the tree **explicitly**, with tree node constructors
- ▶ ENBF-rule for Tree Grammar Rule:
TreeNode → constructor '(' Treenode // ';' ')'
- ▶ Example:
Model → ModelElements *

<http://hydra.nixos.org/build/23332578/download/1/manual/chunk-chapter/demo-sdf.html#idm140737305321888>

Exp           -> String(String)
Exp           -> Int(Int) | Var(Id)
Exp           -> False() | True()
StrChar       -> <string>
String        -> <string>
Int           -> <string>
Id            -> <string>
```

Correct Instance?

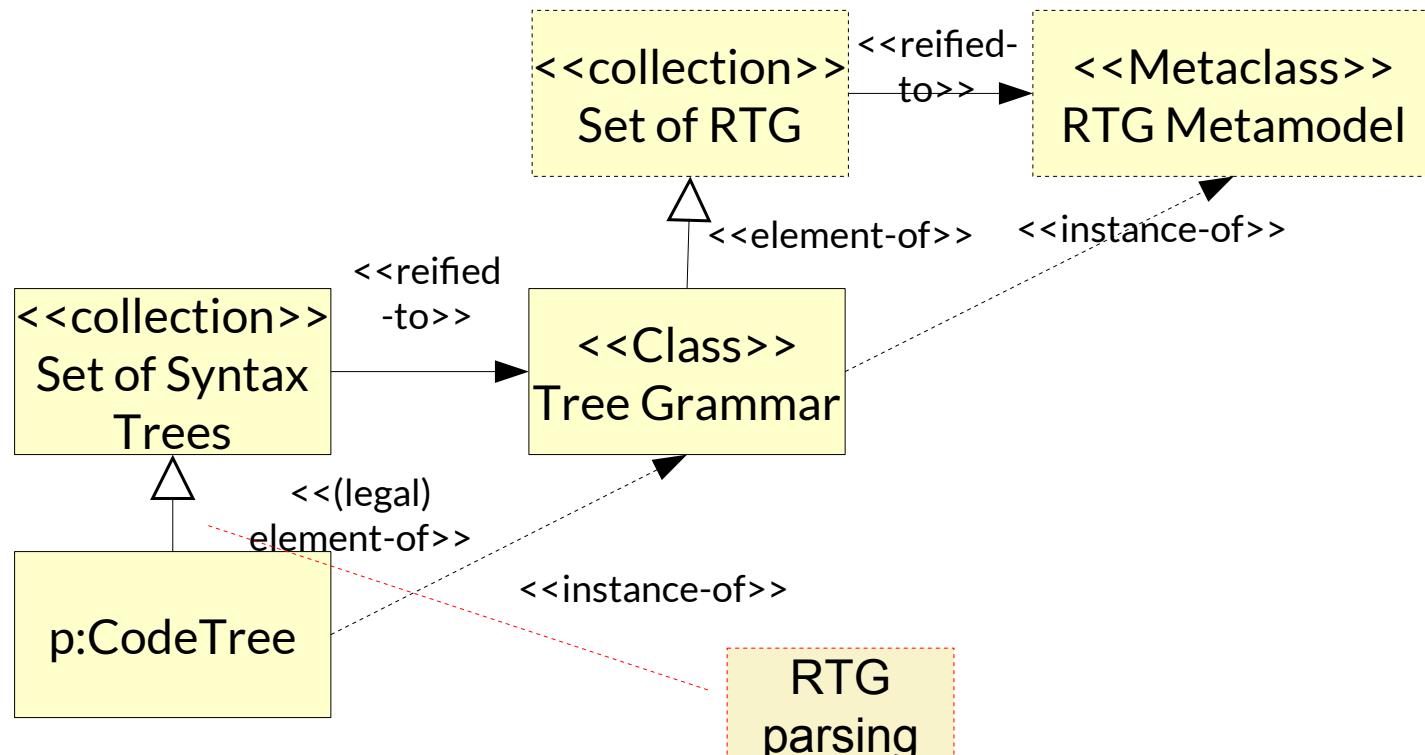

```
// Example: applying TIL grammar to a fragment
ExecuteGrammar(TIL,
    While(NotEqual(Var(x), Var(y)), Assign(Var(x), Plus(Var(x), Int(1)) ))
)
```

Tree Parsing with RTG

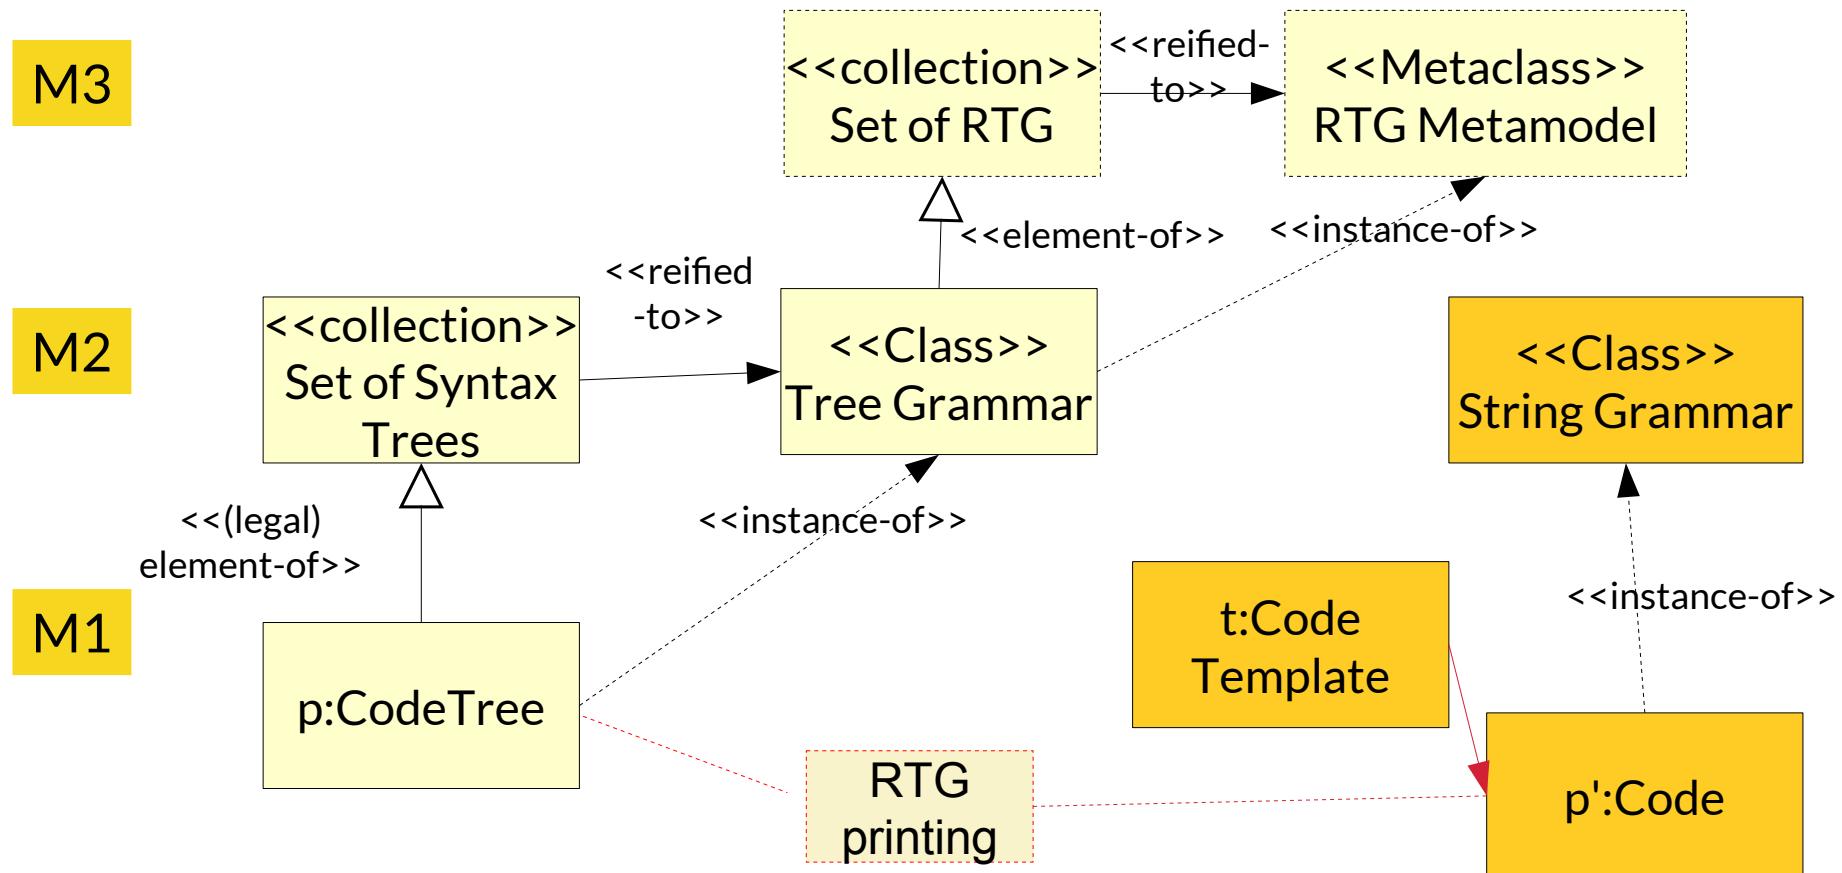

- An RTG can be used to generate a **tree parser** that tests the legality of a code tree with a tree grammar

M3

Tree Pretty-Printing with RTG

- ▶ An RTG can be used to generate a **tree pretty-printer** that prints the nodes of a tree recursively
 - ▶ If p is a code tree, p' can be its pretty-printed copy, derived of a code template t
 - ▶ Exercise: write a pretty-printer for the RTG TIL

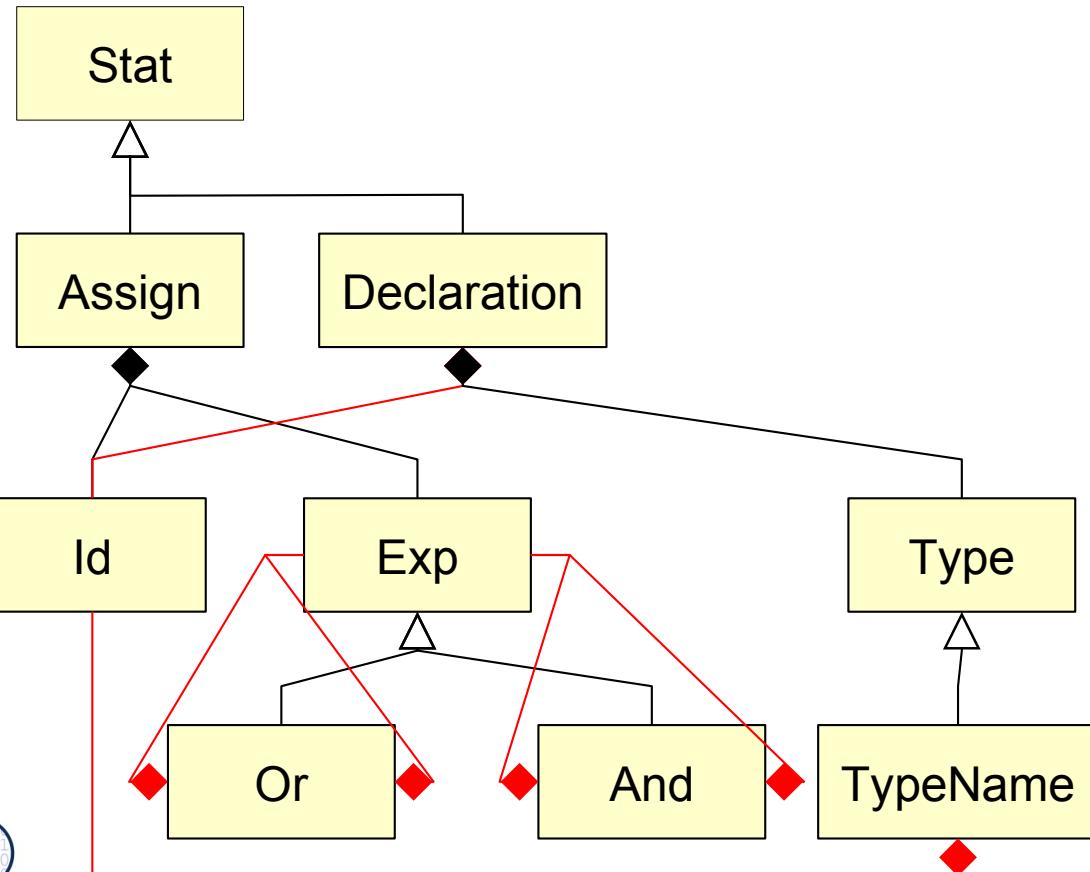

20.2.2. Metamodels and Tree Grammars

- Foll parser also build syntax trees – Design Pattern Builder

Grammars and Metamodels are Very Similar

- ▶ The nonterminals of a grammar form the *name space* of the grammar
- ▶ Definition of a nonterminal (on left side)
- ▶ Use of a nonterminal (on right side) induces relation to definition
- ▶ Metamodels are graphs (including the red edges); grammars are *link trees* (red edges are overlaid)

Stat	-> Assign(Id,Exp)
Stat	-> Declaration(Id,Type)
Type	-> TypeName(Id)
Exp	-> Or(Exp,Exp) And(Exp,Exp)
Id	-> String

20.3. Tree Construction as a Mapping between Parse Grammar and Tree Grammar

- Full parser also build syntax trees – Design Pattern Builder

Tree Construction While Parsing

- ▶ Parsing recognizes the tree structure of a text (concrete syntax, CS)
 - **However, the syntax tree must be built as “action” while parsing**
- ▶ After parsing, the parser creates an **(abstract) syntax tree (AST)**, i.e., builds up a tree with regard to a **regular tree grammar of the abstract syntax (AS)**
 - Recognized nonterminals have to be mapped
 - Tokens, keywords, comments, layouts have to be omitted
 - **Tree building:** Treenodes have to be allocated and composed
- ▶ This **CS-AS mapping (from concrete to abstract syntax)** is created by hand in *side actions* of the parser
 - as action snippet in the rules
- ▶ For simple languages, parsers and tree constructors are no longer written by hand, but generated from *grammars in EBNF*
 - **Parser** recognizes the structure of the text (“Zerteiler des Textes”)
 - **Tree builder** generates an abstract syntax tree
 - **CS-AS-mapping** creates AS nodes after recognition of CS nonterminals

Constructing a Tree Grammar fitting to the String Grammar of Office DSL

        };  
    }
```

Modeling Tools need Several Languages and DSL

- ▶ Bidirekational mapping between technical space “Grammarware” and another one, e.g., “Treeware”, “Link-TreeWare”, “XMLWare”, or “Modelware”

How can an MDSD Tool work flexibly
with several *textual* languages?

Generating parsers and tree builders from string grammars and RTG

... and generate from the RTG ..

Pretty printers (Code generators)

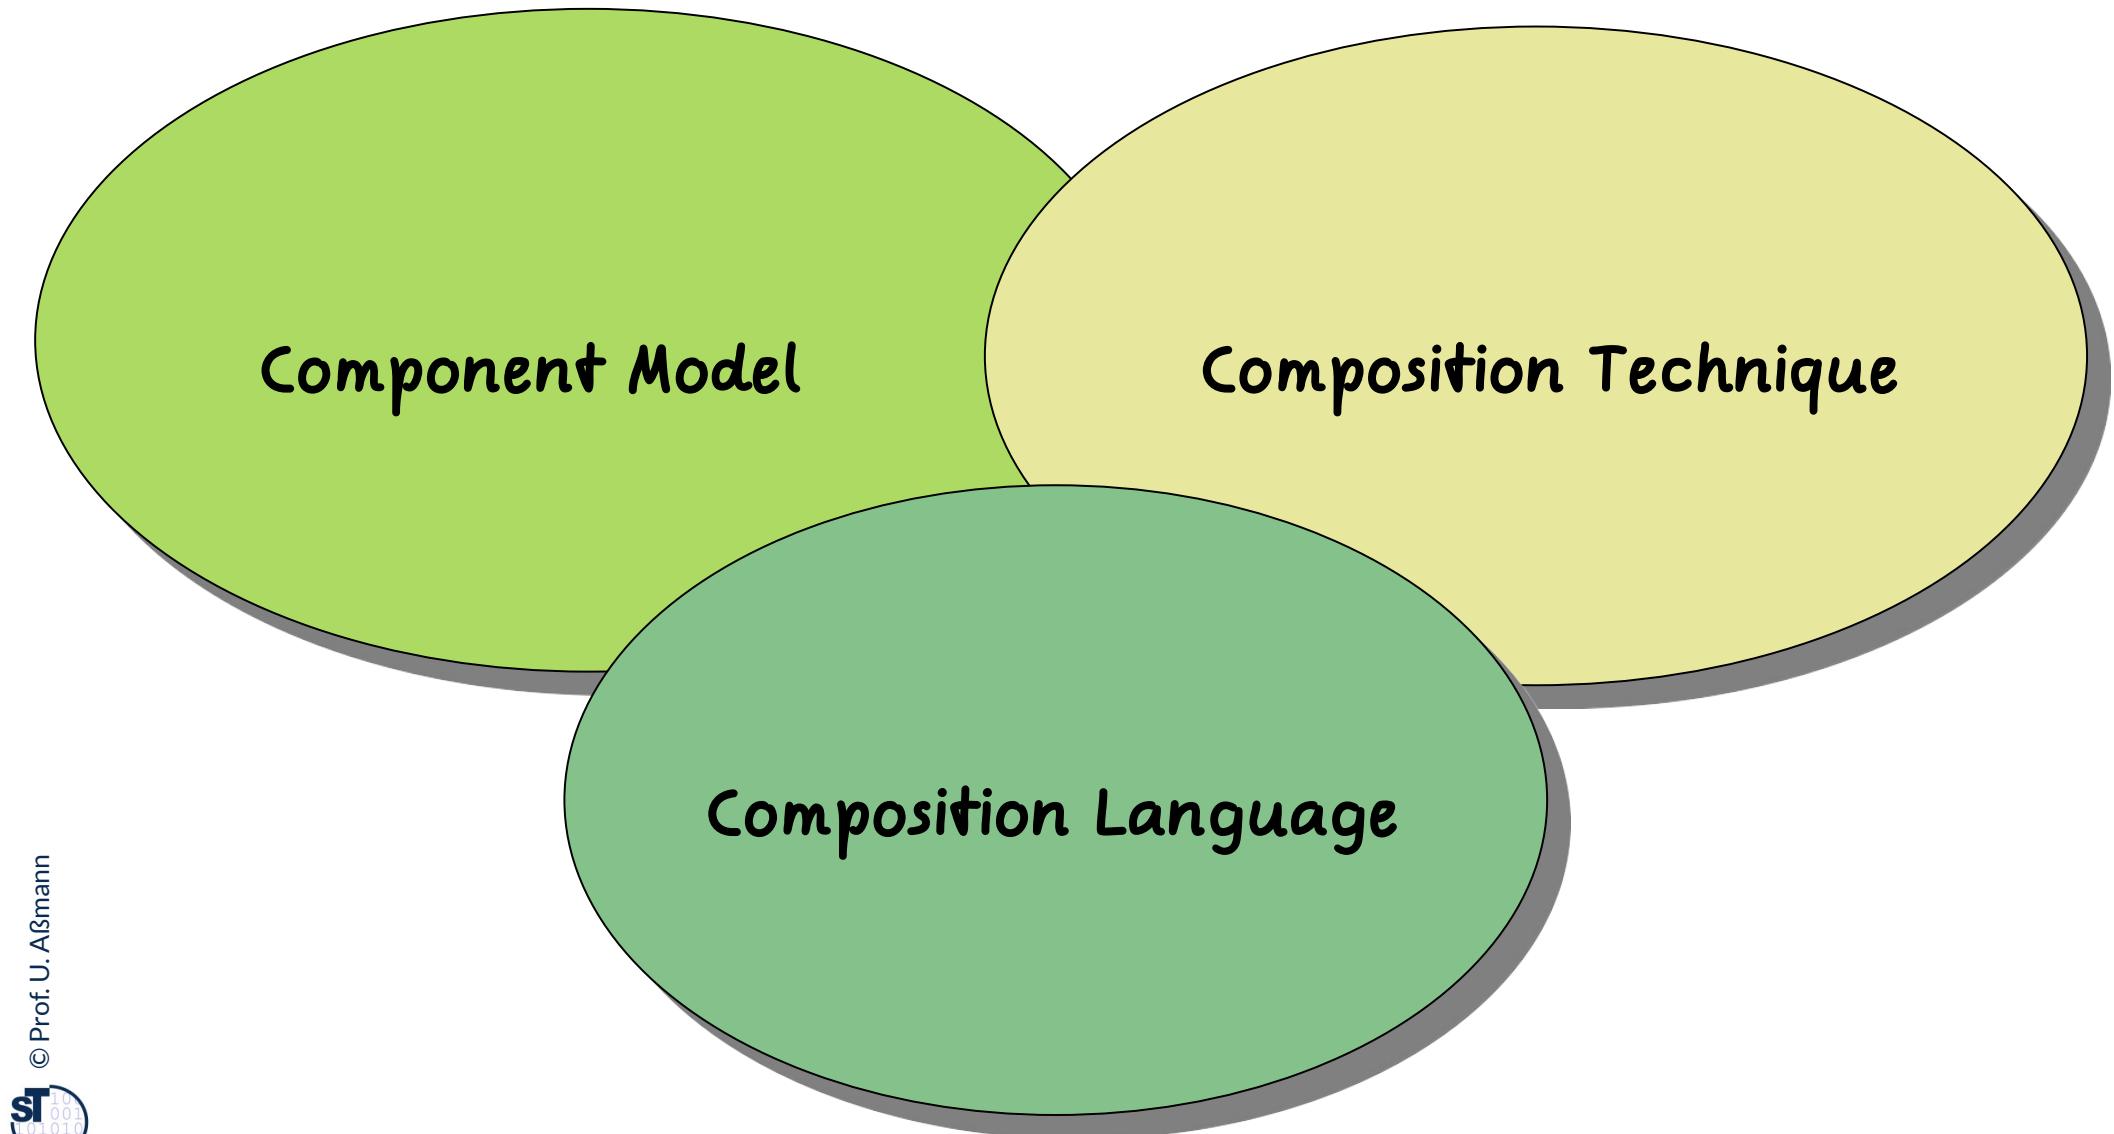

Example: EMFText: EMOF and RTG

- ▶ EMFText uses the parser generator ANTLR to generate parsers
- ▶ The EMOF metamodels have a primary tree that can be written down as RTG
- ▶ Mapping concrete to abstracte syntax:
 - EBNF Grammar and the (implicit) RTG of the corresponding EMF metamodel are mapped *automatically* to each other (language mapping)
- ▶ For pretty printer generation, EMFText uses template-based code generation for the (implicit) RTG

10.4 Text and Tree Algebrae

for composition of texts and trees

Composition with Composition Systems

Composition with Algebras in Mathematics

Component Model:

Set as Carrier

Composition Technique:

Algebra Operators
(union, unify, etc.)

Composition Language:

Functional Language,
Lambda-Calculus

One-sorted Algebra on Texts

- ▶ A **one-sorted algebra** is a set of operators on a carrier set (Trägermenge) of a type (a sort). Example: Texts, sequences of lines of characters
- ▶ Operations
 - E.g., the parser splits texts into lines, separated by newline characters
 - A text template is expanded by a padding (Füllsel)
- ▶ The UNIX Programmers Workbench is built on an algebra on texts:
 - diff: Text x Text → edit-sequence (for a transformation)
 - cmp: Text x Text → Boolean
 - patch: Text x edit-sequence → Text
 - diff3: mine:Text x older:Text x yours:Text → edit-sequence
 - split: Text x Split-char → Text*
 - match/grep: Text x Pattern → Text*
 - check-property: Text x Pattern → Boolean
 - is-consistent: Text x Text → Boolean
 - format: Text → Text
 - expand: Text-template x padding:Text* → Text

CSV: A One-Sorted Algebra on Ascii-Tables

- ▶ Tables consist of sequences of lines, split into columns by a column-separator (TAB , COMMA, |)
 - .csv-tables (comma separated values)
 - html-tables, tex-tables
- ▶ rdb is a command tool suite on an algebra on tables:
 - Diff: table x table → edit-sequence
 - Cmp: File x File → Boolean
 - Patch: table x edit-sequence → table
 - Diff3: mine:table x older:table x yours:table → edit-sequence
 - split: table x Splitzeichen → table*
 - match: table x Pattern → table*
 - check-property: table x Pattern → Boolean
 - is-consistent: table x table → Boolean
 - join, sort, group-by...
 - format: table → table
 - expand: table-template x table* → table

Excursion: CSV and Digital Preservation

- ▶ <https://digital-preservation.github.io/>
- ▶ Digital preservation “Bewahrung des digitalen Kulturerbes”
- ▶ csv schema language
<https://digital-preservation.github.io/csv-schema/csv-schema-1.1.html>
- ▶ <https://jsonformatter.org/xml-parser> online xml parser

Tree Algebra

- ▶ Operations in a simple algebra on trees:
 - Diff: tree × tree → edit-sequence
 - Cmp: File × File → Boolean
 - Patch: tree × edit-sequence → tree
 - Diff3: mine:tree × older:tree × yours:tree → edit-sequence
 - split: tree × node → upper:tree × lower:tree
 - match: tree × Pattern → tree*
 - check-property: tree × Pattern → Boolean
 - is-consistent: tree × tree → Boolean
 - Unify: tree × tree → tree
 - format: tree → tree
 - expand: tree-template × padding:tree* → tree

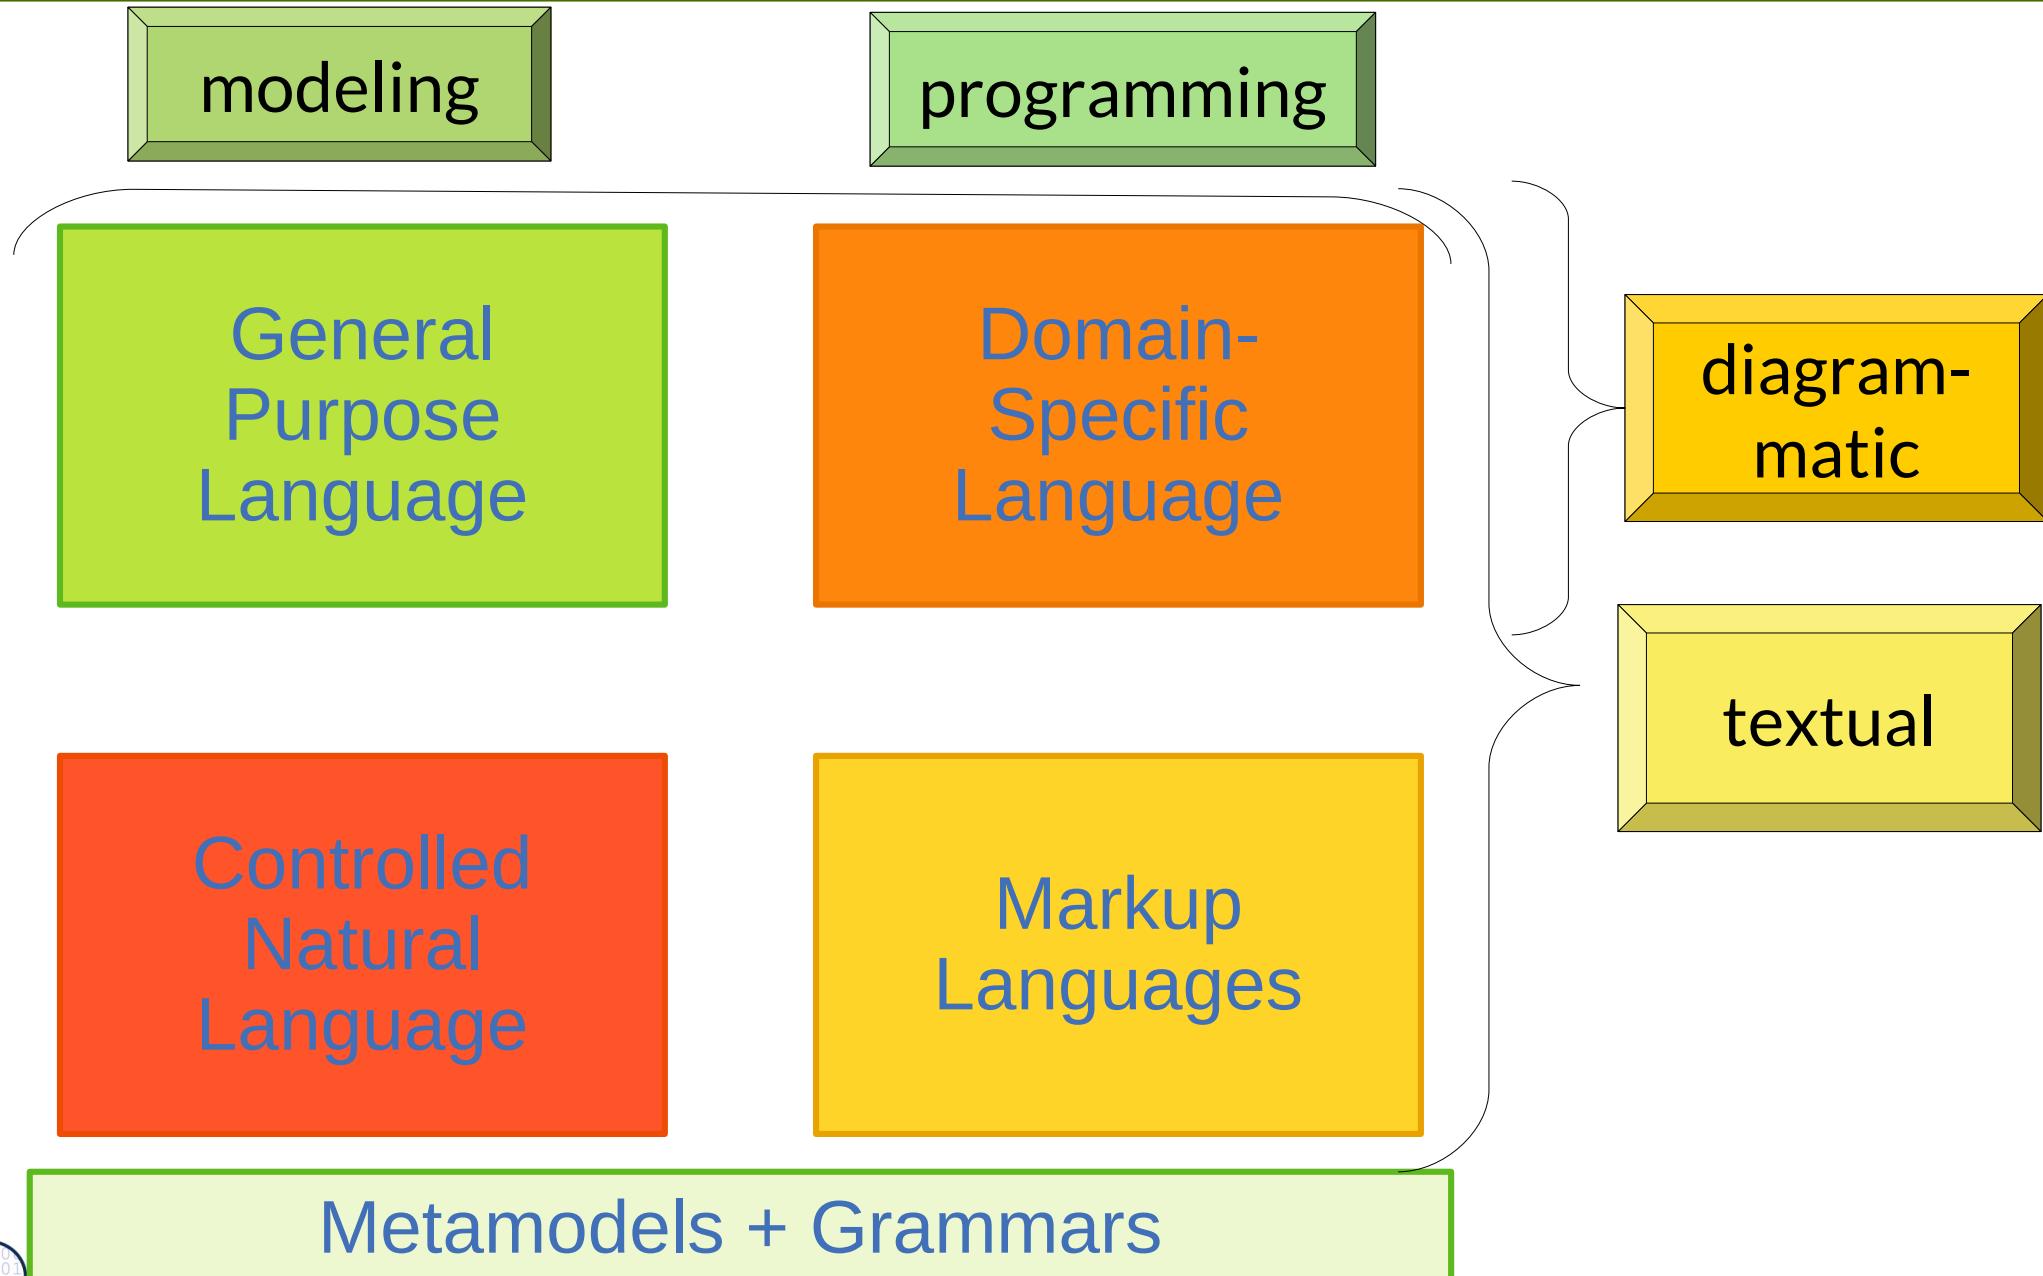

20.5 Controlled Natural Languages (CNL)

- Tobias Kuhn. A survey and classification of controlled natural languages. *Comput. Linguistics*, 40(1):121–170, 2014.
- Anne Cregan, Rolf Schwitter, and Thomas Meyer. Sydney owl syntax - towards a controlled natural language syntax for owl 1.1. In *Proceedings of the OWLED 2007 Workshop on OWL: Experiences and Directions*, volume 258. CEUR-WS, 2007.

Q16: Languages in Software Factories

49

Model-Driven Software Development in Technical Spaces (MOST)

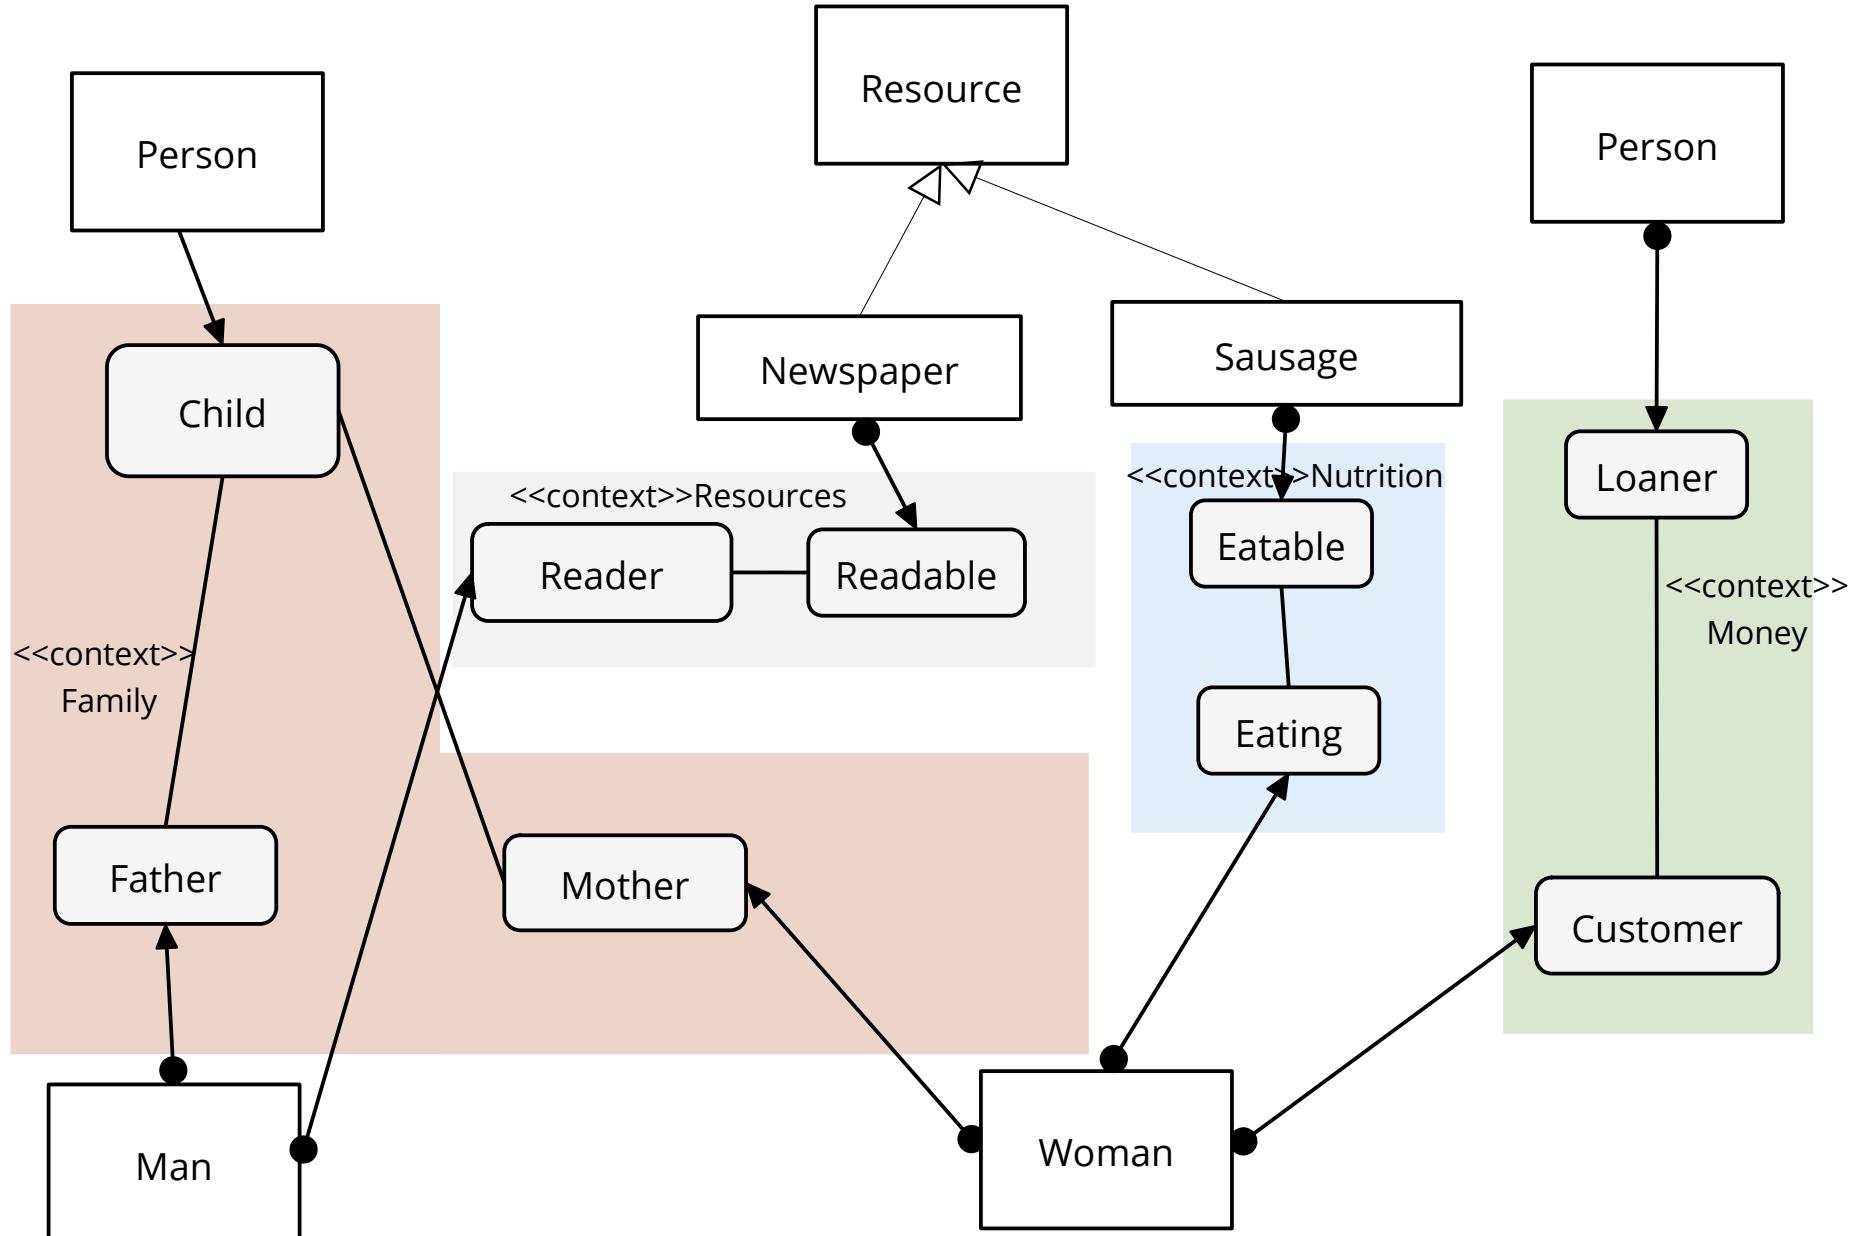

Controlled Natural Languages (CNL)

- ▶ Def.: A ***controlled natural language*** is a restricted natural language that can be described by a formal grammar, either a
 - context-free grammar (e.g., specified by ANTLR)
 - regular tree grammar (e.g., specified by Spoofax)
 - context-sensitive grammar or attributed grammar (e.g., specified by JastAdd, see later).
- ▶ Advantages:
 - Simple, comprehensive syntax
 - In contrast to a natural language, a CNL can be processed easily by tools, because syntax trees for naturally looking texts can be built

Families and Banks in Natural and Role Types (CROM)

51

Model-Driven Software Development in Technical Spaces (MOST)

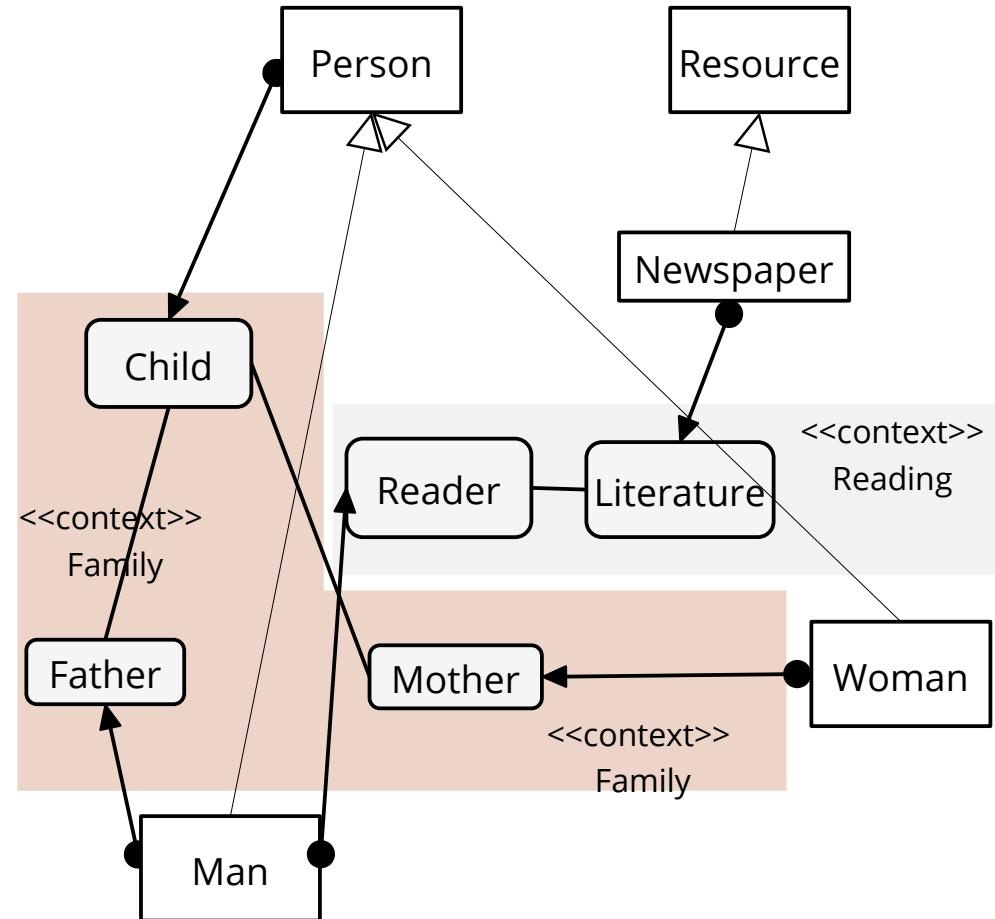

Families and Banks in Natural and Role Types, Specified in Sydney OWL Syntax

52

Model-Driven Software Development in Technical Spaces (MOST)

- ▶ Models can be read or specified in controlled natural language
- ▶ [Cregan] introduces a CNL for OWL ontologies, also useful for CROM
- ▶ Example: Families in CROM:

Every Man is a Person.
Every Woman is a Person.
Every Person may play a Child (in a Family).
Every man:Man may play a Father (in a Family).
Every Child is related to a Mother in a Family
Every Child is related to a Father in a Family.
A man:Main may play a Reader (in Reading).
Every Reader is related to a Literature in Reading.
Every Newspaper is a Resource.
Every Newspaper may play a Literature (in Reading).

PENS Classification

53

Model-Driven Software Development in Technical Spaces (MOST)

- ▶ [Kuhn] Languages can be classified with regard to 4 criteria and school grades.
- ▶ E.g., English is S²E⁵N⁵S².

	Precision	Expressiveness	Naturalness	Simpliicty
English	1	5	5	1
Controlled English	4	3	5	4
Domain-specific language	4	3	5	4
UML Class diagrams	3	3	4	4

20.6 Markup Languages and Pseudocode

<http://en.wikipedia.org/wiki/Pseudocode>

Languages used for documentation

Pseudocode

- ▶ Pseudocode consists of *structured text with keywords and blocks*, z. B. **seq**, **endseq**, **if**, **then**, **else**, **endif**, **while**, **endwhile**, **call**, **action**, **stop**,...
 - Natural text is enclosed as comment, but ignored
- ▶ For pseudocode, grammars can be constructed:
 - Syntax checking with ***island parsing***
 - An ***island grammar*** contains
 - “islands” for the keywords and structure
 - “water” for the free-form text
- ▶ Tool support:
 - Code generation (code templates and comments)
 - Documentation generation (structograms, LaTeX document generation)

Examples for Pseudocode

- ▶ In pseudocode, structure can be recognized (as islands in the free-form water)
- ▶ Pseudocode can recognize names and do a name analysis:
 - Title of procedures, classes, and processes
 - Types from the data dictionary, Local names
- ▶ Pseudocode can define macros

```
process empfangen_Patient 1.3.1
for &Patient
    with >Bestelldatum = Datum in &Termine und >Beschwerden
        if Name*des Patienten* in &Patient
        else "aktualisieren_Patient 1.1"
        if keine >Beschwerden und >Bestelldatum ungueltig
            then „vergeben_Termin 1.2“
        else Uebernahme Patientendaten aus &Patient
            alle Unterlagen fuer Arzt aufbereiten
            <Aufnahme Name*des Patienten* in &Warteliste
            if @Bestdat+Zeit = Kalenderdatum + Uhrzeit
                then Terminpatient Platz m+1*
                    vorhergehender Terminpatient m*
            else Platz n+1*n Anzahl aller Patienten im Wartezimmer*
```

Structural Skeleton of Pseudocode (2)

```
action empfangen_Patient
    while (Patienten oder Praxiseöffnung)
        seq Eingabe >Bestelldatum, >Beschwerden
            if (@Bestdat+Uhrzeit enth. &Termine)
                then Bestellpatient
            else if (@Gebdatum+Name enth. &Patient)
                then ziehen Patientenakte
                else call aktualisieren_Patientendaten
            endif
            if (>Beschwerden <> 0*vorhanden*)
                then Unbestellter_Patient
                else call vergeben_Termin
            endif endif
        Aufbereiten aller Unterlagen fuer Arzt endseq
        if (Bestellpatient)
            then <Aufnahme Platz m+1 in &Warteliste
            else <Aufnahme Platz n+1 in &Warteliste
        endif endwhile
    stop
```

LATEX, XML and Pseudocode

- ▶ Markup languages structure pseudocode with **markup tags**.

```
\documentclass{article}

\title{My first Document}
\author{John Doe}
\usepackage[english]{babel}

\begin{document}

\maketitle

Hello World! My name is John Doe.

\emph{Next paragraph has to be written.}

\end{document}
```

Support for Pseudocode

- ▶ LaTeX-distributions have good style packages for pseudocode:
 - `algorithms.sty`
 - `\usepackage{algpseudocode}`
 - `\usepackage{algorithmicx}`
 - `listings.sty`
- ▶ See also ELAN, the semi-natural programming language
 - <http://de.wikipedia.org/wiki/ELAN>
 - Part of OS L3, predecessor of L4

```
PACKET stack handling DEFINES push,pop,init
stack:
    LET max = 1000;
    ROW max INT VAR stack;
    INT VAR stack pointer;
    PROC init stack:
        stack pointer := 0
    END PROC init stack;
    PROC push (INT CONST dazu wert):
        stack pointer INCR 1;
        IF stack pointer > max
            THEN errorstop ("stack overflow")
        ELSE stack [stack pointer] := dazu wert
        END IF
    END PROC push;

    PROC pop (INT VAR von wert):
        IF stack pointer = 0
            THEN errorstop ("stack empty")
        ELSE von wert := stack [stack pointer];
        stack pointer DECR 1
        END IF
    END PROC pop

END PACKET stack handling;
```

- <http://os.inf.tu-dresden.de/L3/usrman/node10.html>

Summary

- ▶ Parser generators belong to the tool set of a software engineer
- ▶ Parsers can parse
 - Texts (lines of rows)
 - CSV relations (lines of delimiter-separated tuples)
 - Pseudocode with island grammars
- ▶ The parser only parses the context-free structure of the programms, document, or model;
- ▶ Syntax trees are built from a mapping of concrete to abstract syntax
- ▶ Context conditions, integrity and wellformedness constraints are delayed to the *static semantic analysis* on the syntax tree

The End

- ▶ Why is a parser often delivering several results (parses)?
- ▶ How can you disambiguate ambiguous rules?
- ▶ Why is string parsing not the same as tree parsing? What is the difference of concrete and abstract syntax trees?
- ▶ Explain the difference of
 - A string grammar vs a tree grammar
 - A concrete syntax grammar (CS grammar) vs an abstract syntax grammar (AS grammar)

20.A.1 Port-Graph Algebrae on Fragments

Invasive Software Composition is a general, typed templating technique for all languages

- ... based on port-graph algebrae
- ... with Graybox Components
- ... preview onto the summer (CBSE course)

“Invasive” Composition (Typed Templating) with Port-Graph Algebrae

63

Model-Driven Software Development in Technical Spaces (MOST)

Component Model:

**Fragment Components and
their Ports (Slots and
Hooks)**

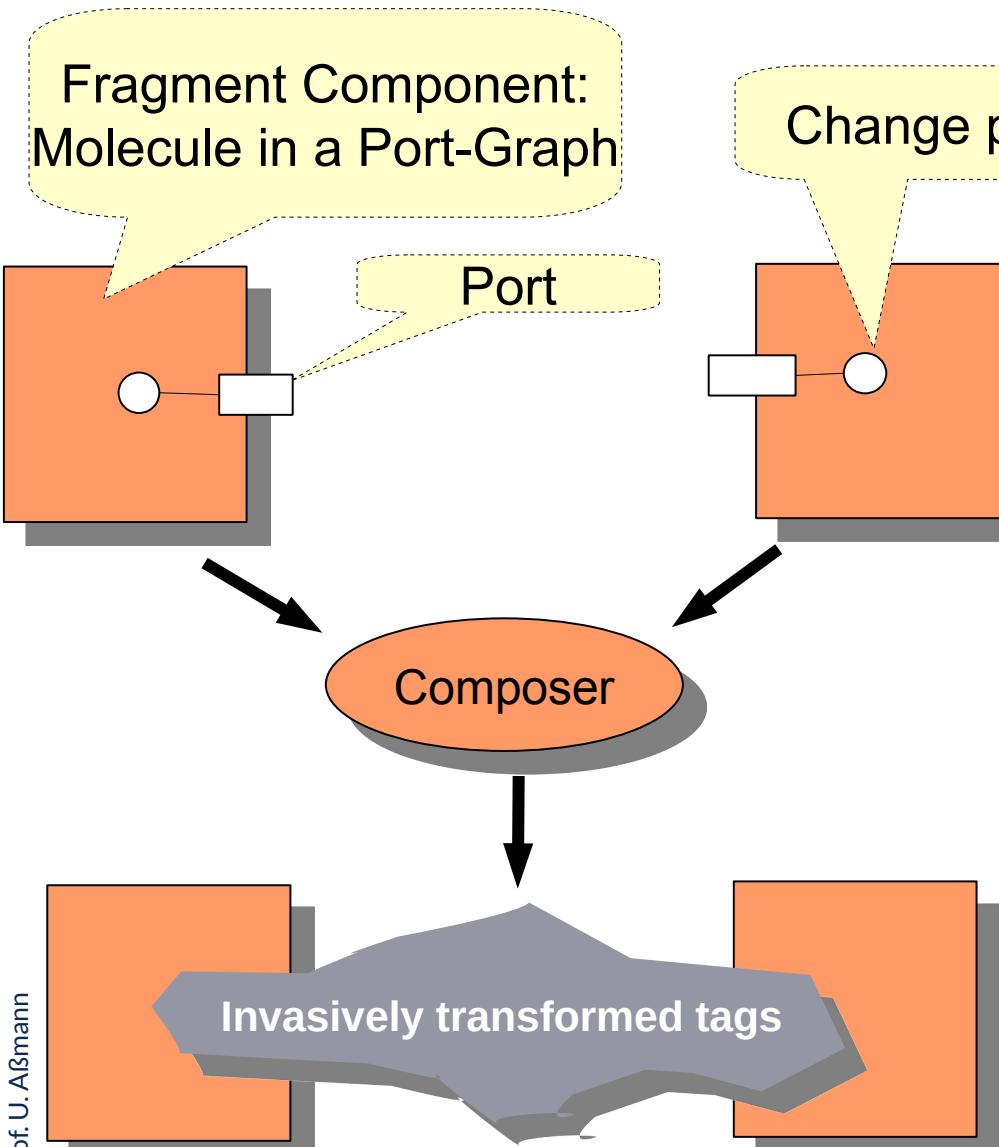

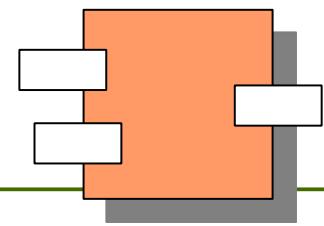

Composition Technique:

Hook Transformation

Composition Language:

Standard Languages

Invasive Composition as Hook Transformations

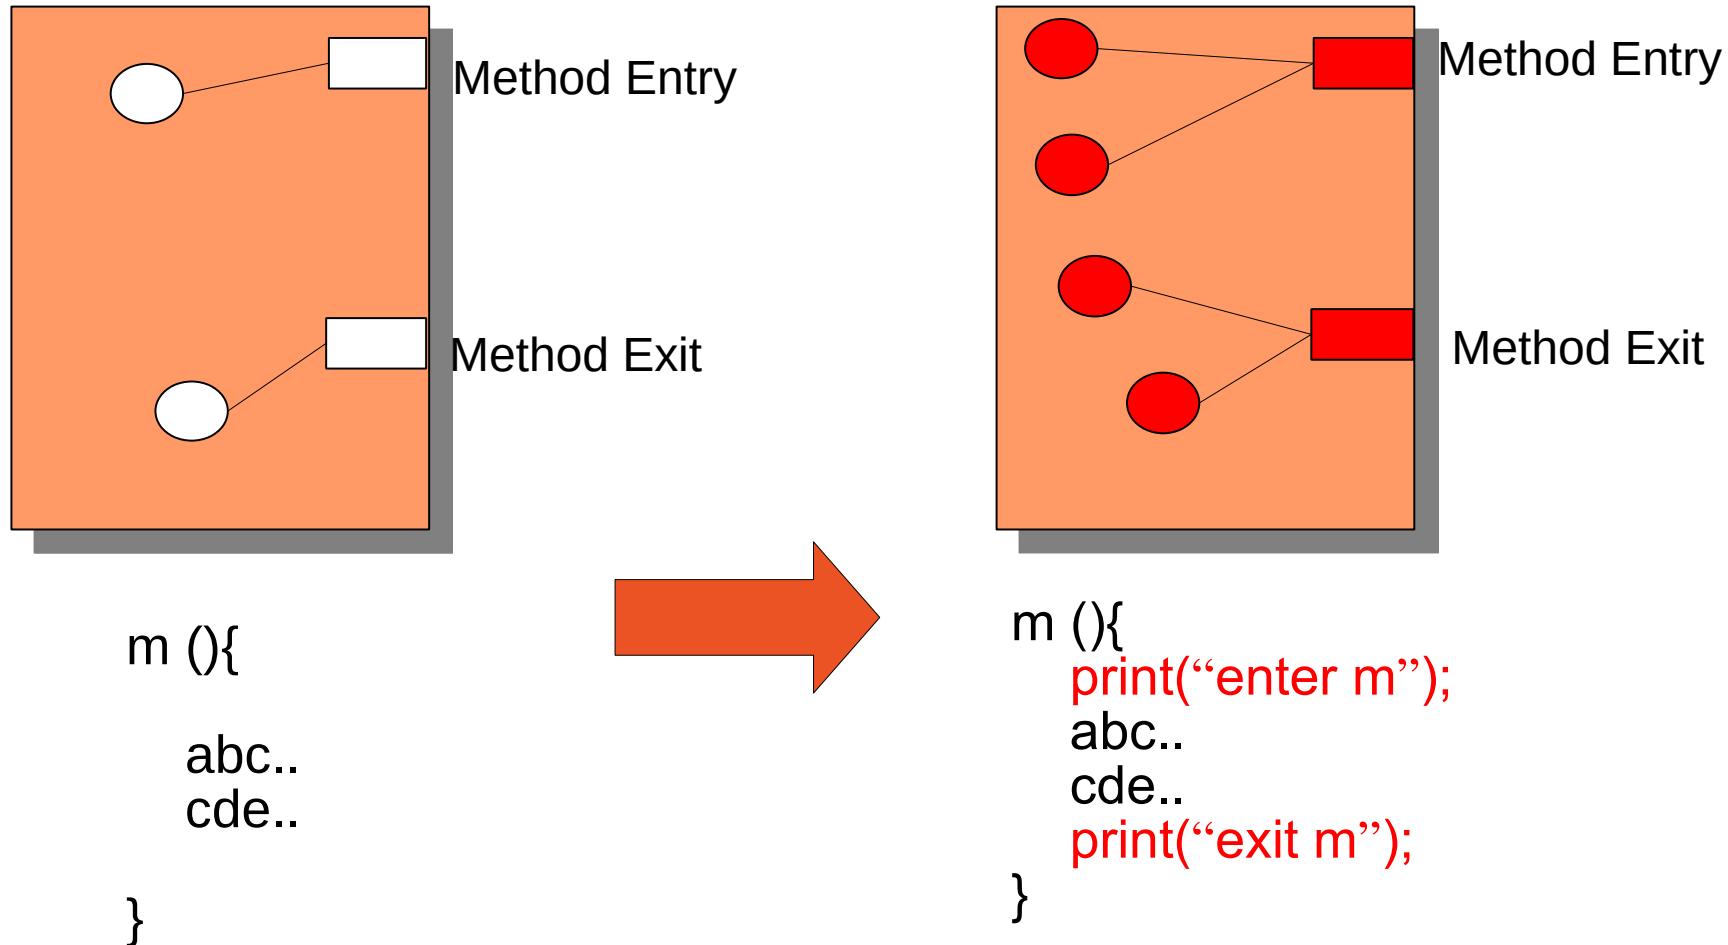

- ▶ A **port graph** is a graph in which each node (molecule) has a set of *ports*
- ▶ A **fragment component** is a molecule with ports (slots, hooks, query points) related to change points

Invasive Composition adapts and extends fragment components at ports (slots, hooks, query-points) by composition operators

Binding Implicit Hooks with Fragments

65

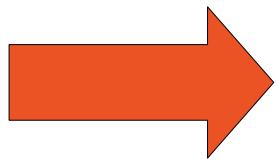

Model-Driven Software Development in Technical Spaces (MOST)

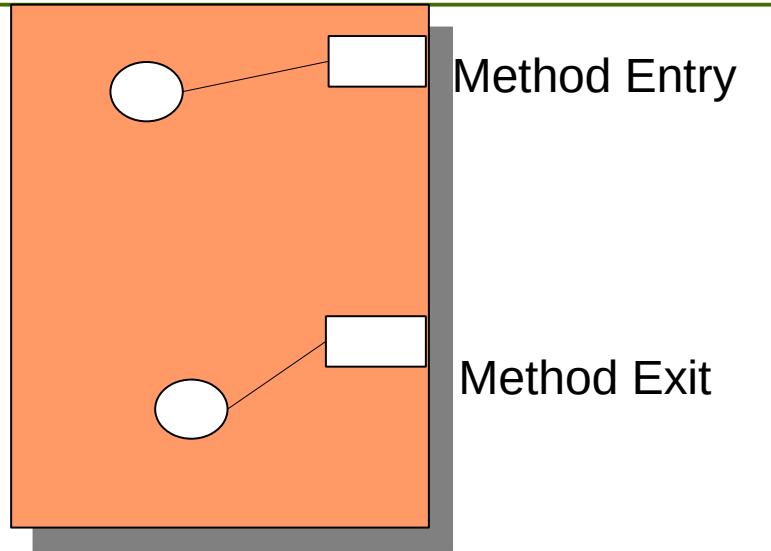

```
component.findHook(..MethodEntry..).extend("print(\"enter m\");");  
component.findHook(..MethodExit..).extend("print(\"exit m\");");
```

Partial Parsing of Fragment Components

```
m (){  
    abc..  
    cde..  
}
```

```
m (){\n    // Method Entry\n    abc..\n    cde..\n    // Method Exit\n}
```

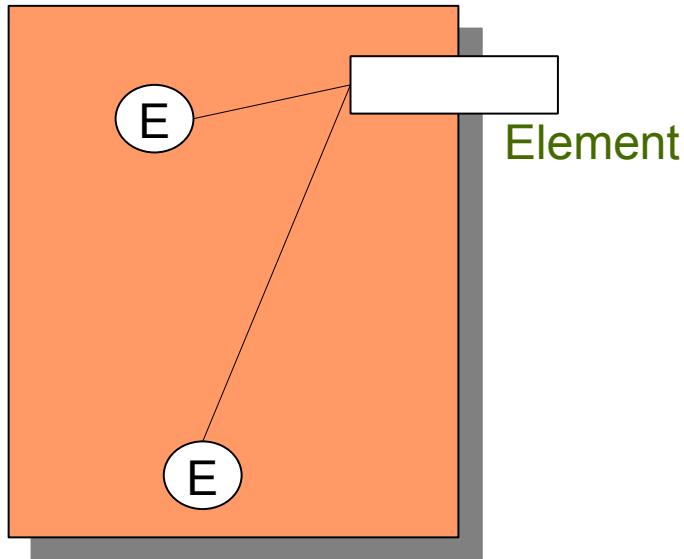

```
Component = compositionSystem.partialParser(„m (){ abc.. cde.. }“);
```

Binding Declared Hooks with Fragments

67

Model-Driven Software Development in Technical Spaces (MOST)

List(**E**) list;

List(**Apple**) list;

....
list.add(new **E**());

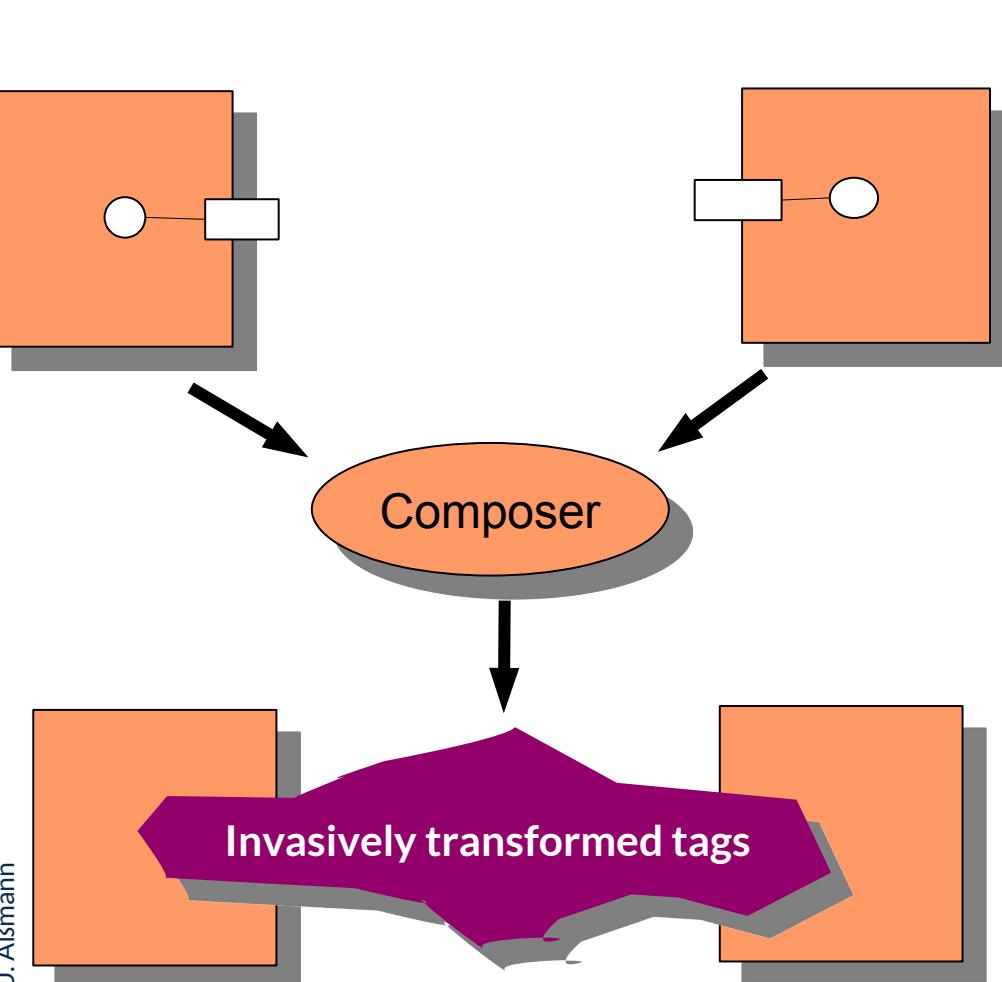

....
list.add(new **Apple**());

...

...

```
box.findHook(“Element”).bind(“Apple”);
```

Invasive Composition as Hook Transformations

- ▶ Invasive Composition works uniformly on
 - For all languages
 - For declared hooks and implicit hooks
- ▶ Allows for unification of
 - Inheritance
 - Views
 - Aspect weaving
 - Parameterization
 - Role model merging

Operators in a Port-Graph Algebra

Simple composition operators

- ▶ **bind hook** (parameterize)
 - For generic programming
- ▶ **rename component, rename hook**
- ▶ **remove value from hook (unbind)**
- ▶ **extend component or hook**
extensions
- ▶ **copy fragment component**

Compound composition operators

- ▶ **inheritance** from component
 - For object-oriented
programming
- ▶ **view of component**
 - view-based programming
- ▶ **connect hook 1 and 2**
 - For connector-based
programming
- ▶ **distribute component over other
component**
 - For aspect weaving

Q7: Phases of a Source Code Importers into a Repository and the Generating Tools

6 Model-Driven Software Development in Technical Spaces (MOST)

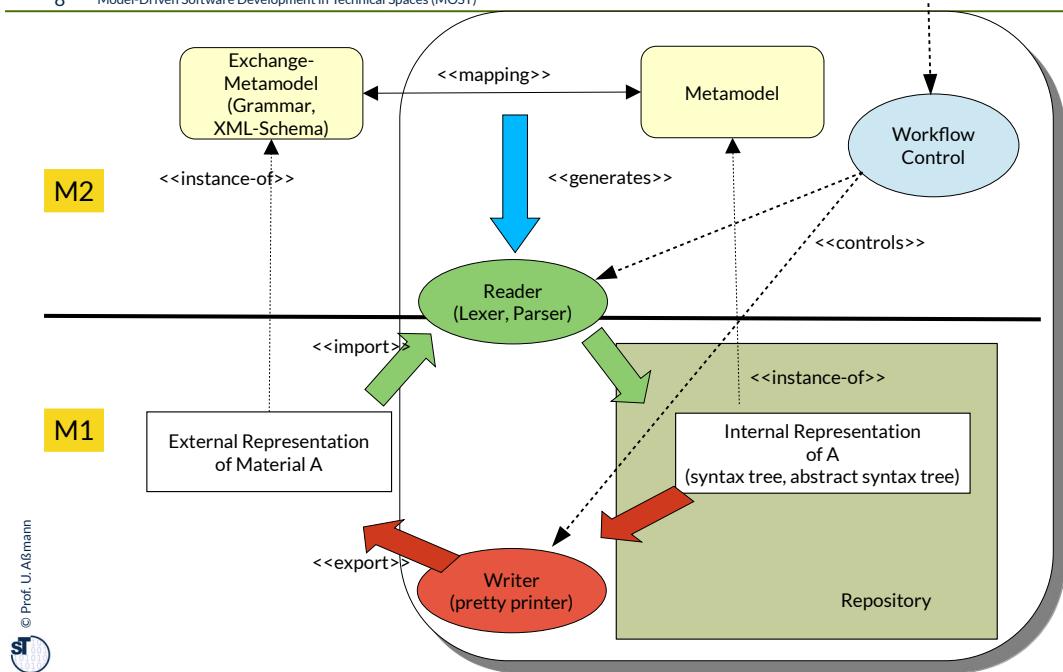

Beispiel LLVM bauen

Q9: Phases of Compilers and Software Tools and Generators

from Introductory Chapter “Architecture”

Rpt.: Use of Generated Importers and Exporters in Modelling Tools

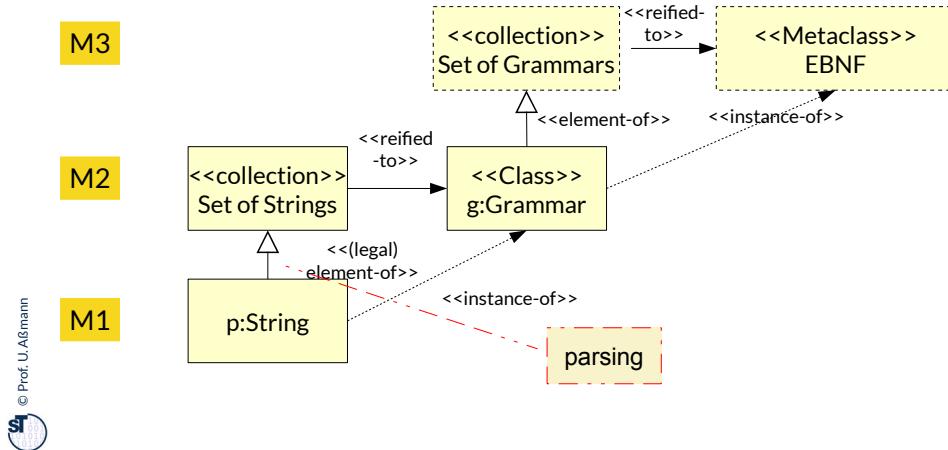

Problem 1 of Parsing

- ▶ Parsing a program, model or document, or a material means to **recognize its context-free structure in the linear stream of characters**
 - Parsers are usually the first phases of a tool when it *imports a material*
- ▶ Parsers parse according to the *concrete syntax grammar* containing
 - Whitespace handling
 - Block handling (brackets)
 - Comment handling
- ▶ From a context-free grammar, a **parse automaton with parse rules** can be derived:
 - Address ::= Streetname StreetNumber Location
 - Location ::= Postcode Town Country
- ▶ Generates the parse rules
 - Streetname StreetNumber Location → Address
 - Postcode Town Country → Location
- ▶ The parser reads in all tokens until it can decide which rule to reduce

String/Text Parsing with Grammars

- ▶ A grammar can be used to generate a parser for strings (texts) that tests the legality of a string with the grammar
- ▶ The parser checks <<instance-of>> for the string p with regard to the grammar g

EBNF Rules for String Grammars

Symbol	Meaning	Example
Name (Nonterminal)	Identifier (for type or variable)	A = B + C
"text"	Token (text terminal)	B ::= "Town" + R
=, ::=	Consists of	X ::= X1 + X2 + X3
+, also juxtaposition	Sequence	X ::= X1 X2 X3
@	Key (unique identifier)	P = @PersonNr + N + Address
[... ...]	Selection (alternative)	P = [P1 P2]
n { ... } m	Iteration, at least n upto m times	B = 1{ C } 10
n *	Iteration of n - arbitrarily many times	Children ::= Name *
n +	Iteration of n at least once	PastEmployers ::= Name +
(...)	Optional	Address ::= Street + (PostBox)
A // ","	Sequence of A with intermittend ","	C = D // ","
* ... *	Comment	X = B + C *text*
< a > b	Modifier (Kommentar)	< old > A < new > A
SYN	Synonym für Name	SecondName SYN SurName

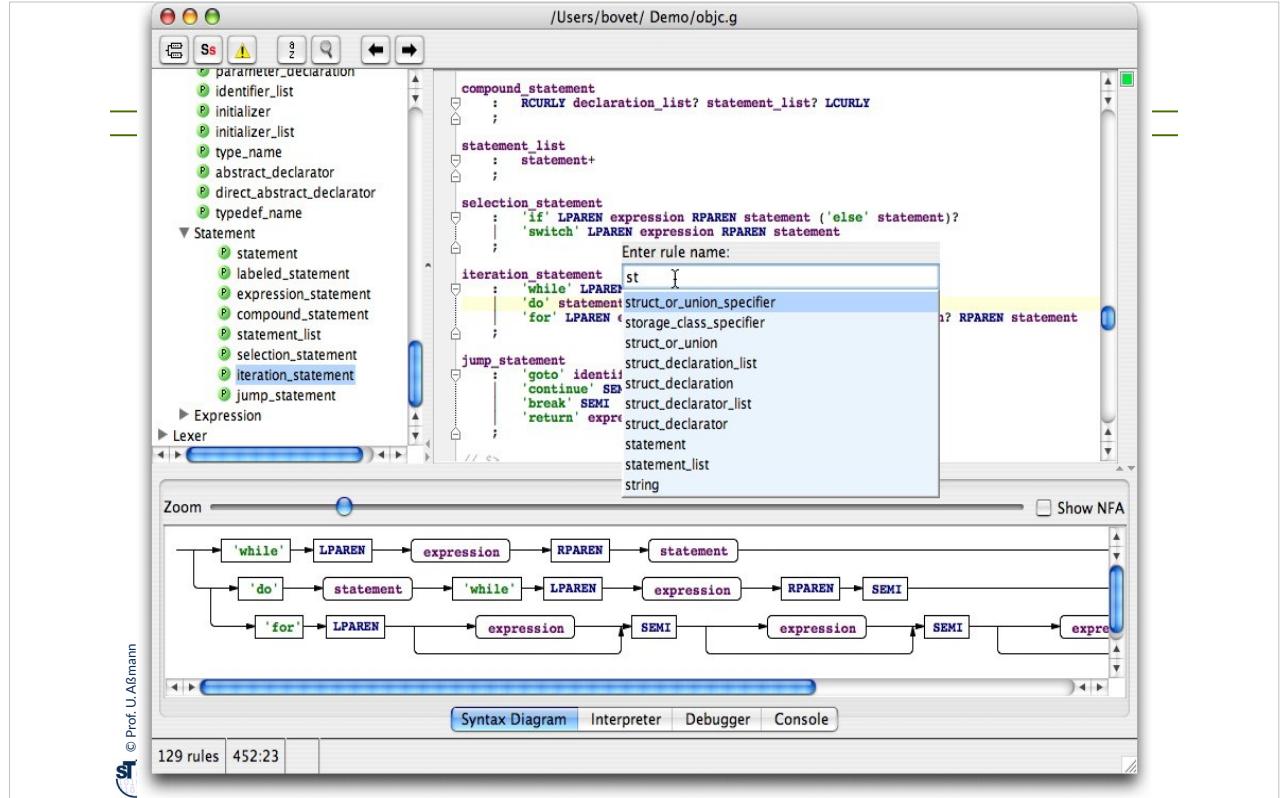

Example: Address Grammar

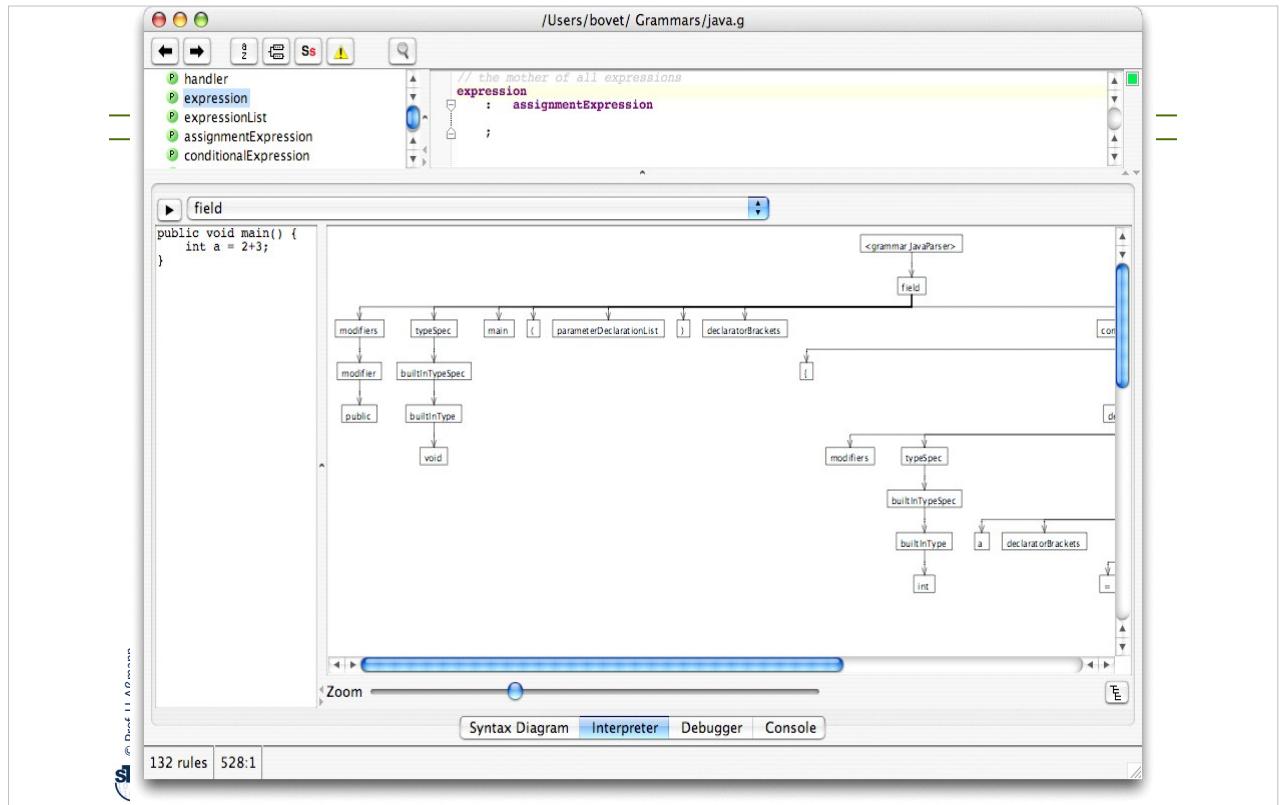

- ▶ “::=” means “is-composed-of” or “is-decomposed-to”
- ▶ Every rule declares a whole-part decomposition
- ▶ Grammar declares the structure of a part list

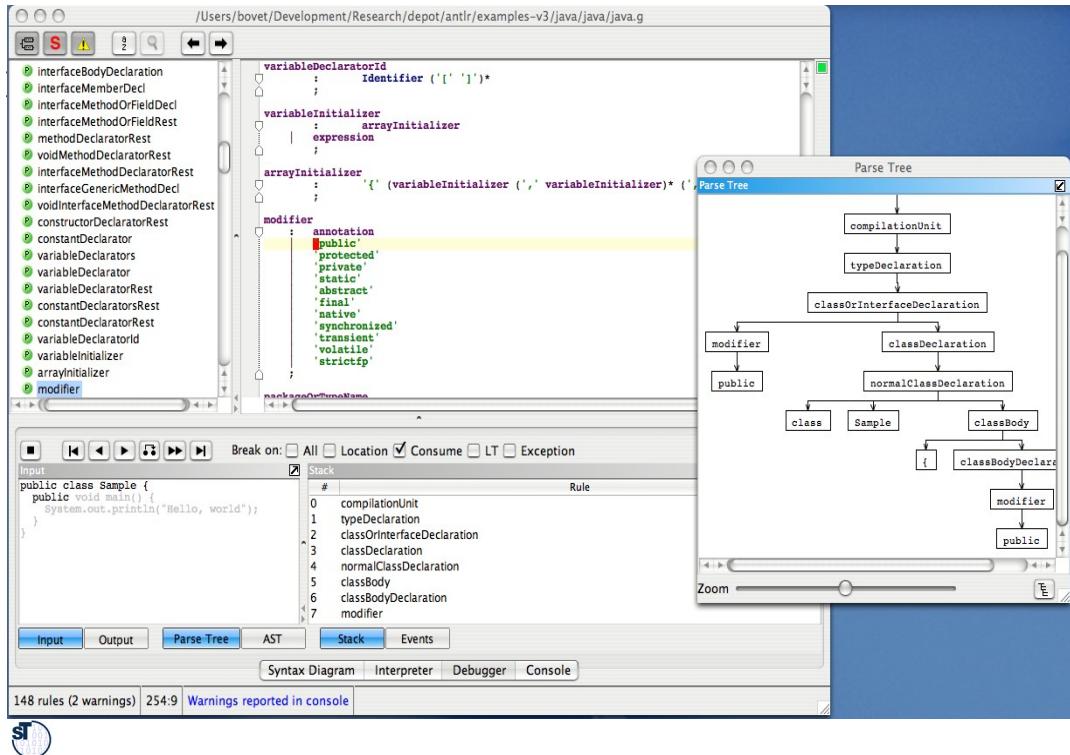

```
Address      ::= Person Company Location.
Person       ::= Title Name
Title        ::= „Dr.“ | „Prof. Dr.“ | „Mr.“ | „Ms.“
Name         ::= FirstName* LastName
Company      ::= String
Location     ::= Street StreetNumber Postcode Town
FirstName    ::= String
LastName     ::= String
Postcode     ::= 5{Digit}5
Street       ::= String
StreetNumber  ::= Integer [ String ]
Town         ::= String
```

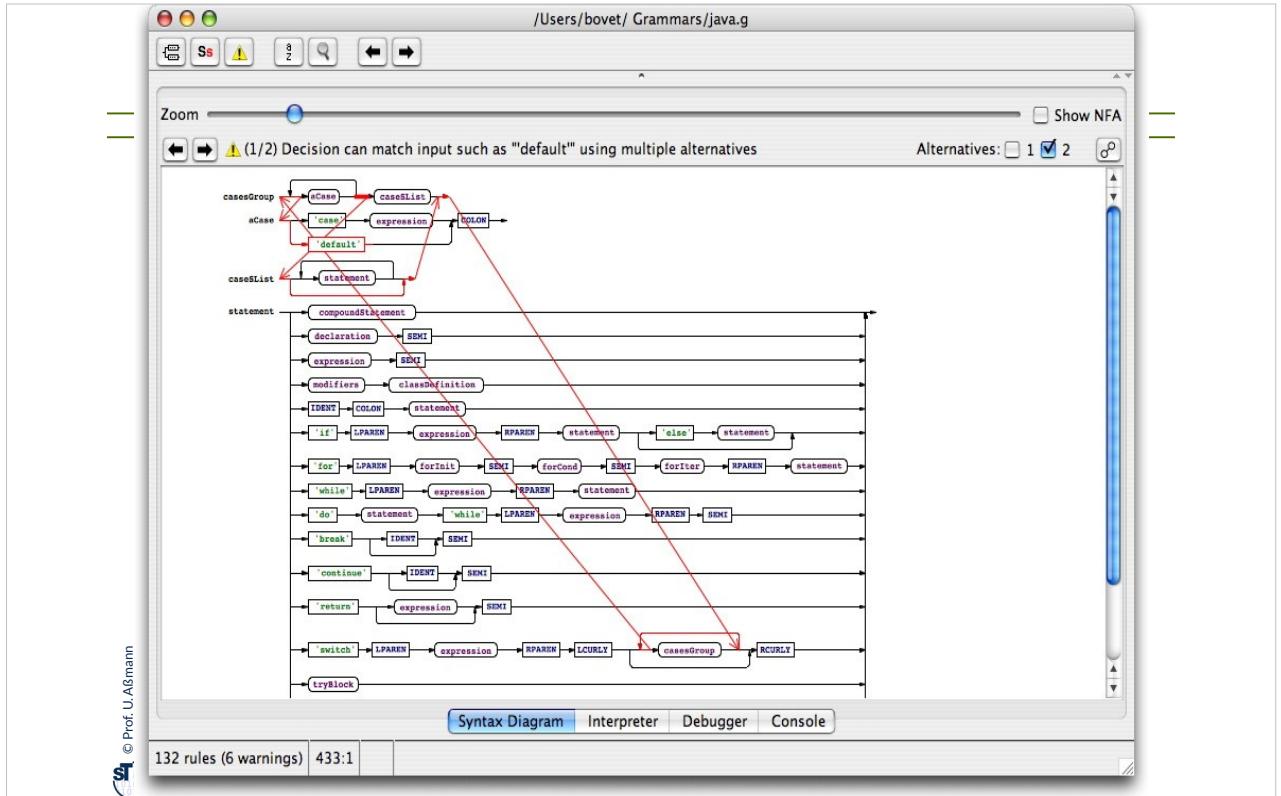

Example: ANTLR www.antlr.org

- ▶ Since the 90s, many parser generators have been built for C/C++
 - Cocktail's lalr, ell, lark www.cocolab.de
 - Fnc2 (INRIA)
 - flex und bison (GNU)
 - Eli is a fast compiler generator toolset <http://eli.su.net>
- ▶ For Java, ANTLR is popular
 - Parser class LL(k): Left-recursive grammar rules, k-lookahead for decisions
 - Generated Parser with algorithm “recursive descent”
 - http://www.bearcave.com/software/antlr/antlr_expr.html

20.1.2 Program Interpretation While Parsing

An ANTLR Grammar for the Input Language of Pocket Calculator

- ▶ ANTLR knows several *actions* (*snippets, fragments*) in a rule
 - *semantic actions*: modifying attributes of nodes or temporary values
 - *emissions*: emitting tokens of an output alphabet, e.g., for code generation
 - *motions*: emitting an action on a shared environment (“motion grammars”)
 - e.g., for controlling a robot
 - Motion grammars usually influence parsing also!

Actions Calculating Attributes

- ▶ Pocket calculator interpretes the program to calculate one attribute \$value
 - Interpretation needs non-terminal attributes, which are stored on the stack of the parser
- ▶ Usually, the parse automaton with the parse rules is not shown, because it is rather complex
- ▶ Debugging a generated parser is no fun

```
grammar Expr;
@header {
package test;
import java.util.HashMap;
}
@lexer::header (package test;)
@members {
/** Map variable name to Integer object holding value */
HashMap memory = new HashMap();

The screenshot shows the ANTLRWorks 2.5.0 interface. The top pane displays the grammar file `Expr.g` with the following content:

```

grammar Expr;
@header {
    package test;
    import java.util.HashMap;
}
@lexer::header {package test;}
@members {
    /** Map variable name to Integer object holding value */
    HashMap memory = new HashMap();
}

prog: stat+;

stat: expr NEWLINE
    | ID '=' expr NEWLINE
    | {memory.put($ID.text, new Integer($expr.value))};
    | NEWLINE
    | ;

expr returns [int value]
: e=multExpr {$value = $e.value;}
  ( '+' e=multExpr {$value += $e.value;}
  | '-' e=multExpr {$value -= $e.value;}
  )
;

```

The bottom pane shows the parse tree for input "2 + 3 - 4". The tree structure is as follows:

```

graph TD
    root --> prog
    prog --> stat
    stat --> expr
    expr --> multExpr1[multExpr]
    multExpr1 --> atom1[atom 2]
    multExpr1 --> plus1[+]
    multExpr1 --> multExpr2[multExpr]
    multExpr2 --> atom2[atom 3]
    multExpr2 --> plus2[+]
    multExpr2 --> atom3[atom 4]

```

The tabs at the bottom of the interface include: Input, Output, Parse Tree, AST, Stack, Events, Syntax Diagram, Interpreter, Debugger (selected), and Console.

Applications of String Grammars

Applications can be everything that has to do with *ordered strings*:

- ▶ Protocol checking in component-based systems (protocol automata and grammars)
- ▶ Document processing
- ▶ Matching text patterns and data mining in files, emails, streams
- ▶ Communication in multi-agent systems

20.2 Regular Tree Grammars (RTG)

- String grammars are for structuring sequences
- RTG are for specifying trees, syntax trees and abstract syntax trees
- A RTG does not care about concrete syntax

Regular Tree Grammars

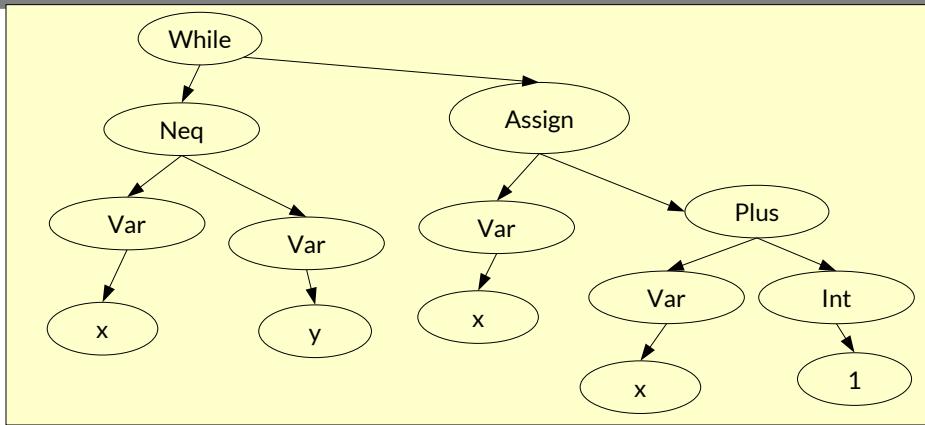

<http://hydra.nixos.org/build/23332578/download/1/manual/chunk-chapter/demo-sdf.html#idm140737305321888>

- ▶ String Grammars assume:
 - Sequence of words
 - Implicit syntax tree, because non-terminals specify it implicitly
- ▶ *Regular Tree Grammars* specify the tree **explicitly**, with tree node constructors
- ▶ ENBF-rule for Tree Grammar Rule:
TreeNode → constructor '(' Treenode // ';' ')'
- ▶ Example:
Model → ModelElements *

```
// Regular Tree Grammar from Stratego

Correct Instance?

```
// Example: applying TIL grammar to a fragment
ExecuteGrammar(TIL,
    While(Neq(Var(x),Var(y)), Assign(Var(x),Plus(Var(x),Int(1)) ))
)
```

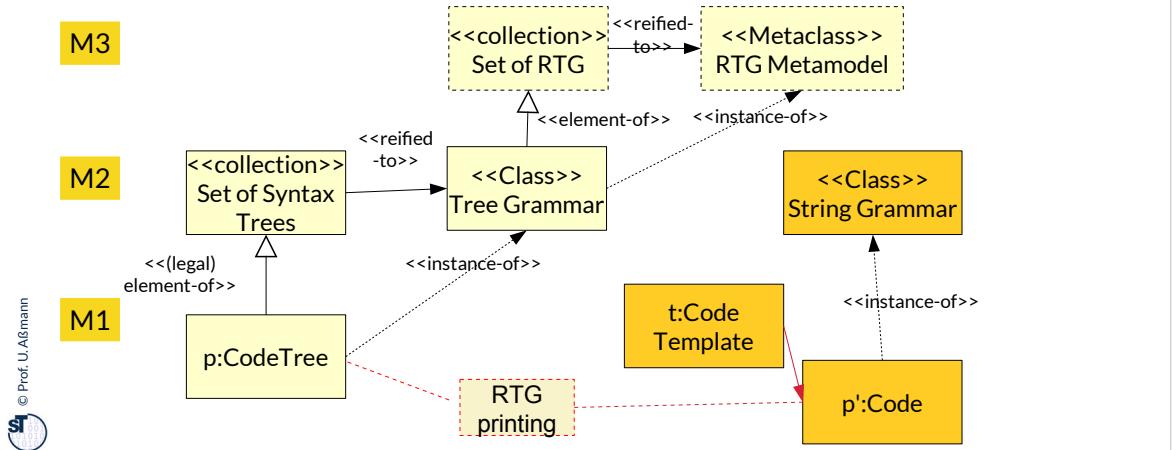

Tree Parsing with RTG

- ▶ An RTG can be used to generate a **tree parser** that tests the legality of a code tree with a tree grammar

Tree Pretty-Printing with RTG

- ▶ An RTG can be used to generate a **tree pretty-printer** that prints the nodes of a tree recursively
- ▶ If p is a code tree, p' can be its pretty-printed copy, derived of a code template t
- ▶ Exercise: write a pretty-printer for the RTG TIL

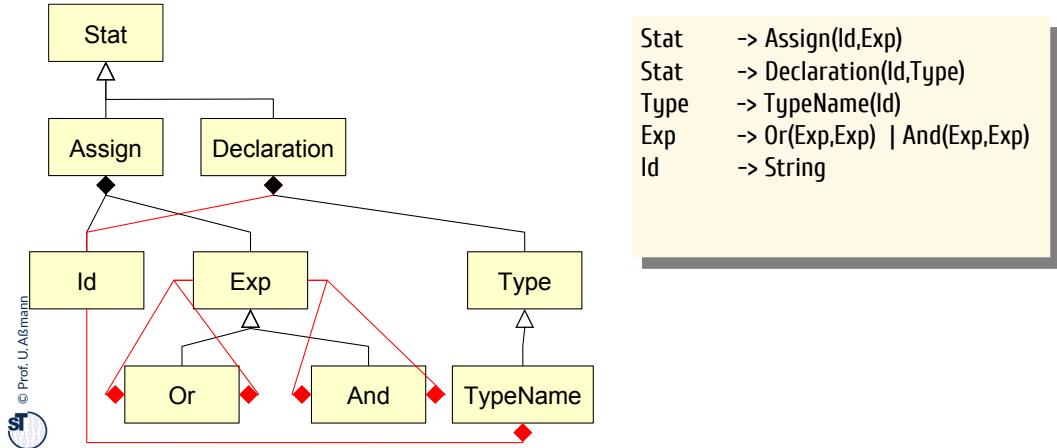

20.2.2. Metamodels and Tree Grammars

- Full parser also build syntax trees – Design Pattern Builder

Grammars and Metamodels are Very Similar

- ▶ The nonterminals of a grammar form the *name space* of the grammar
- ▶ Definition of a nonterminal (on left side)
- ▶ Use of a nonterminal (on right side) induces relation to definition
- ▶ Metamodels are graphs (including the red edges); grammars are *link trees* (red edges are overlaid)

20.3. Tree Construction as a Mapping between Parse Grammar and Tree Grammar

- Full parser also build syntax trees – Design Pattern Builder

Tree Construction While Parsing

- ▶ Parsing recognizes the tree structure of a text (concrete syntax, CS)
 - However, the syntax tree must be built as “action” while parsing
- ▶ After parsing, the parser creates an (**abstract syntax tree (AST)**, i.e., builds up a tree with regard to a **regular tree grammar of the abstract syntax (AS)**)
 - Recognized nonterminals have to be mapped
 - Tokens, keywords, comments, layouts have to be omitted
 - **Tree building:** Treenodes have to be allocated and composed
- ▶ This **CS-AS mapping (from concrete to abstract syntax)** is created by hand in *side actions* of the parser
 - as action snippet in the rules
- ▶ For simple languages, parsers and tree constructors are no longer written by hand, but generated from *grammars in EBNF*
 - **Parser** recognizes the structure of the text (“Zerteiler des Textes”)
 - **Tree builder** generates an abstract syntax tree
 - **CS-AS-mapping** creates AS nodes after recognition of CS nonterminals

Constructing a Tree Grammar fitting to the String Grammar of Office DSL

```

    Employee ::= "employee" name[]  
               "works" "in" worksIn[]  
               "works" "with"  
               worksWith[] ("," worksWith[])* ;  
}
```

.CS Grammar Plus Mapping to RTG (Abstract Syntax Tree)

- ▶ CS-AS mapping works via side actions of the grammar rules ("transducer")
- ▶ Tree is built while returning from recursive descent

```

Modeling Tools need Several Languages and DSL

- ▶ Bidirektonal mapping between technical space “Grammarware” and another one, e.g., “Treeware”, “Link-TreeWare”, “XMLWare”, or “Modelware”

How can an MDSD Tool work flexibly
with several *textual* languages?

Generating parsers and tree builders from string grammars and RTG

... and generate from the RTG ..

Pretty printers (Code generators)

Example: EMFText: EMOF and RTG

- ▶ EMFText uses the parser generator ANTLR to generate parsers
- ▶ The EMOF metamodels have a primary tree that can be written down as RTG
- ▶ Mapping concrete to abstract syntax:
 - EBNF Grammar and the (implicit) RTG of the corresponding EMF metamodel are mapped *automatically* to each other (language mapping)
- ▶ For pretty printer generation, EMFText uses template-based code generation for the (implicit) RTG

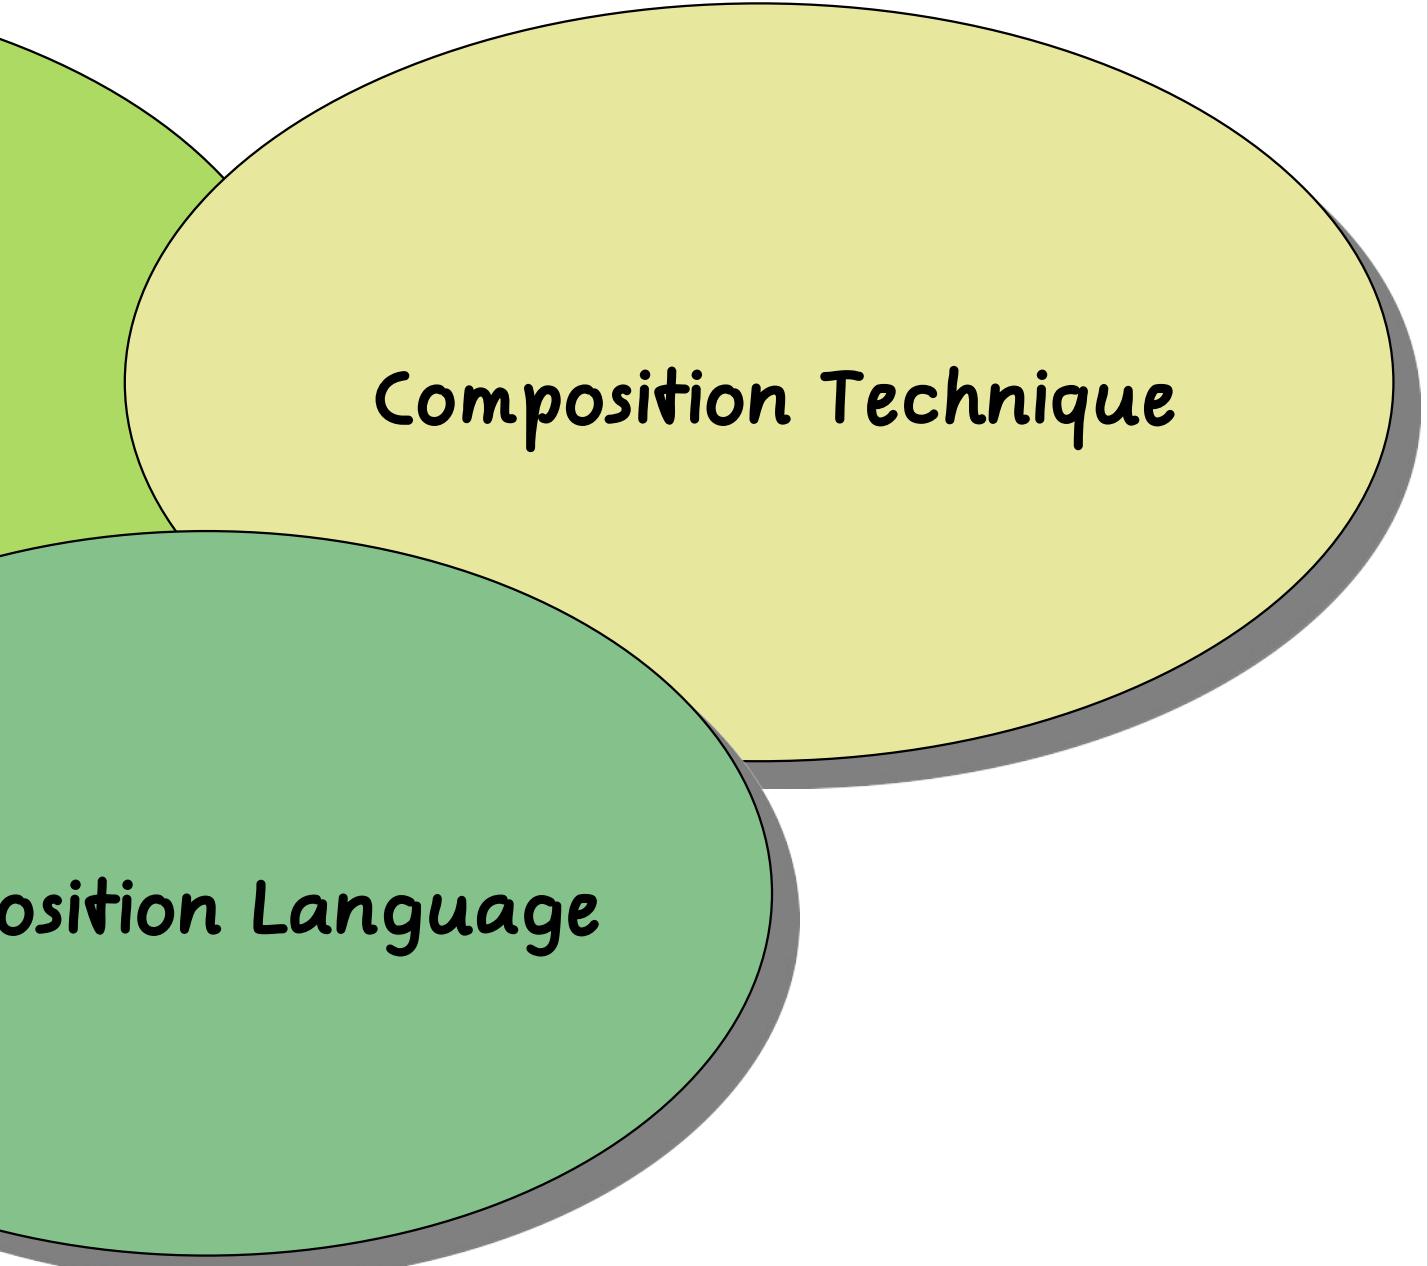

10.4 Text and Tree Algebrae

for composition of texts and trees

position Systems

OST)

Composition Technique

osition Language

Algebrae in Mathematics

(OST)

Composition Technique:

Algebra Operators
(union, unify, etc.)

Composition Language:

Functional Language,
Lambda-Calculus

One-sorted Algebra on Texts

- ▶ A **one-sorted algebra** is a set of operators on a carrier set (Trägermenge) of a type (a sort). Example: Texts, sequences of lines of characters
- ▶ Operations
 - E.g., the parser splits texts into lines, separated by newline characters
 - A text template is expanded by a padding (Füllsel)
- ▶ The UNIX Programmers Workbench is built on an algebra on texts:
 - diff: Text x Text → edit-sequence (for a transformation)
 - cmp: Text x Text → Boolean
 - patch: Text x edit-sequence → Text
 - diff3: mine:Text x older:Text x yours:Text → edit-sequence
 - split: Text x Split-char → Text*
 - match/grep: Text x Pattern → Text*
 - check-property: Text x Pattern → Boolean
 - is-consistent: Text x Text → Boolean
 - format: Text → Text
 - expand: Text-template x padding:Text* → Text

CSV: A One-Sorted Algebra on Ascii-Tables

- ▶ Tables consist of sequences of lines, split into columns by a column-separator (TAB, COMMA, |)
 - .csv-tables (comma separated values)
 - html-tables, tex-tables
- ▶ rdb is a command tool suite on an algebra on tables:
 - Diff: table x table → edit-sequence
 - Cmp: File x File → Boolean
 - Patch: table x edit-sequence → table
 - Diff3: mine:table x older:table x yours:table → edit-sequence
 - split: table x Splitzeichen → table*
 - match: table x Pattern → table*
 - check-property: table x Pattern → Boolean
 - is-consistent: table x table → Boolean
 - join, sort, group-by...
 - format: table → table
 - expand: table-template x table* → table

Excursion: CSV and Digital Preservation

- ▶ <https://digital-preservation.github.io/>
- ▶ Digital preservation “Bewahrung des digitalen Kulturerbes”
- ▶ csv schema language
<https://digital-preservation.github.io/csv-schema/csv-schema-1.1.html>
- ▶ <https://jsonformatter.org/xml-parser> online xml parser

Tree Algebra

- ▶ Operations in a simple algebra on trees:
 - Diff: tree × tree → edit-sequence
 - Cmp: File × File → Boolean
 - Patch: tree × edit-sequence → tree
 - Diff3: mine:tree × older:tree × yours:tree → edit-sequence
 - split: tree × node → upper:tree × lower:tree
 - match: tree × Pattern → tree*
 - check-property: tree × Pattern → Boolean
 - is-consistent: tree × tree → Boolean
 - Unify: tree × tree → tree
 - format: tree → tree
 - expand: tree-template × padding:tree* → tree

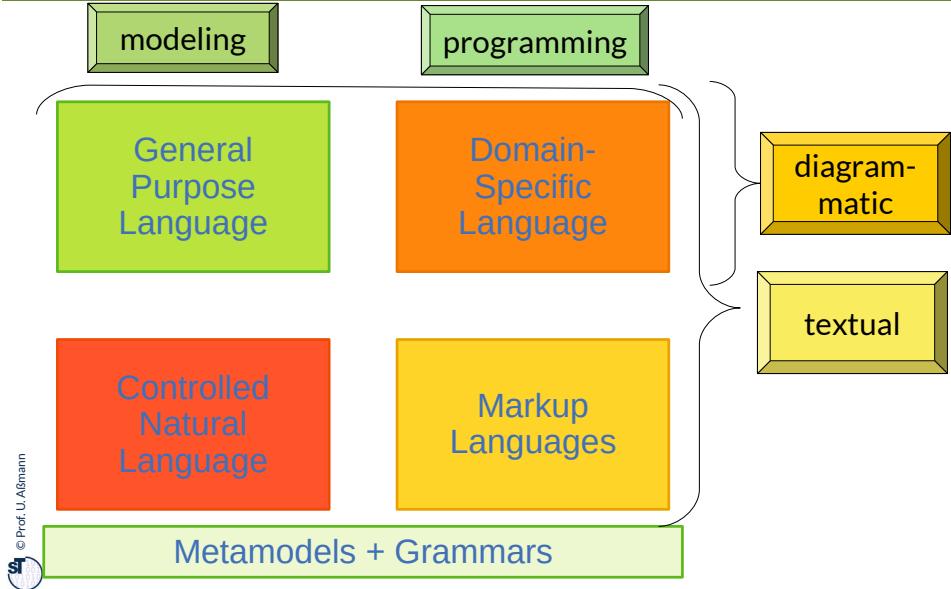

20.5 Controlled Natural Languages (CNL)

- Tobias Kuhn. A survey and classification of controlled natural languages. *Comput. Linguistics*, 40(1):121–170, 2014.
- Anne Cregan, Rolf Schwitter, and Thomas Meyer. Sydney owl syntax - towards a controlled natural language syntax for owl 1.1. In *Proceedings of the OWLED 2007 Workshop on OWL: Experiences and Directions*, volume 258. CEUR-WS, 2007.

Q16: Languages in Software Factories

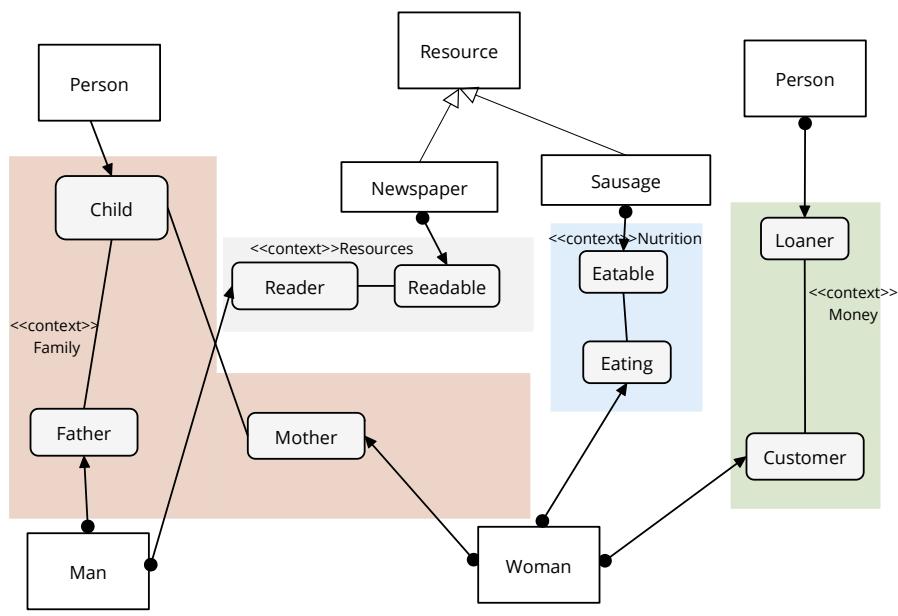

49 Model-Driven Software Development in Technical Spaces (MOST)

Controlled Natural Languages (CNL)

- ▶ Def.: A **controlled natural language** is a restricted natural language that can be described by a formal grammar, either a
 - context-free grammar (e.g., specified by ANTLR)
 - regular tree grammar (e.g., specified by Spoofax)
 - context-sensitive grammar or attributed grammar (e.g., specified by JastAdd, see later).
- ▶ Advantages:
 - Simple, comprehensive syntax
 - In contrast to a natural language, a CNL can be processed easily by tools, because syntax trees for naturally looking texts can be built

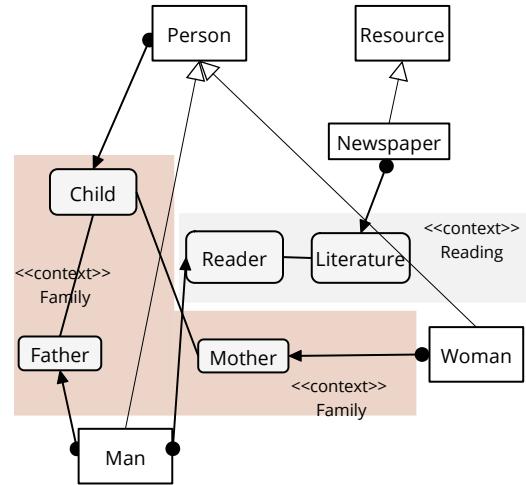

Families and Banks in Natural and Role Types (CROM)

Families and Banks in Natural and Role Types, Specified in Sydney OWL Syntax

- ▶ Models can be read or specified in controlled natural language
- ▶ [Cregan] introduces a CNL for OWL ontologies, also useful for CROM
- ▶ Example: Families in CROM:

```
Every Man is a Person.  
Every Woman is a Person.  
Every Person may play a Child (in a Family).  
Every man:Man may play a Father (in a Family).  
Every Child is related to a Mother in a Family  
Every Child is related to a Father in a Family.  
A man:Main may play a Reader (in Reading).  
Every Reader is related to a Literature in Reading.  
Every Newspaper is a Resource.  
Every Newspaper may play a Literature (in Reading).
```

PENS Classification

- ▶ [Kuhn] Languages can be classified with regard to 4 criteria and school grades.
- ▶ E.g., English is S²E⁵N⁵S².

	Precision	Expressiveness	Naturalness	Simpliicty
English	1	5	5	1
Controlled English	4	3	5	4
Domain-specific language	4	3	5	4
UML Class diagrams	3	3	4	4

20.6 Markup Languages and Pseudocode

<http://en.wikipedia.org/wiki/Pseudocode>
Languages used for documentation

Pseudocode

- ▶ **Pseudocode** consists of *structured text with keywords and blocks*, z. B. **seq, endseq, if, then, else, endif, while, endwhile, call, action, stop...**
 - Natural text is enclosed as comment, but ignored
- ▶ For pseudocode, grammars can be constructed:
 - Syntax checking with *island parsing*
 - An *island grammar* contains
 - “islands” for the keywords and structure
 - “water” for the free-form text
- ▶ Tool support:
 - Code generation (code templates and comments)
 - Documentation generation (structograms, LaTeX document generation)

Examples for Pseudocode

- ▶ In pseudocode, structure can be recognized (as islands in the free-form water)
- ▶ Pseudocode can recognize names and do a name analysis:
 - Title of procedures, classes, and processes
 - Types from the data dictionary, Local names
- ▶ Pseudocode can define macros

```
process empfangen_Patient 1.3.1
for &Patient
    with >Bestelldatum = Datum in &Termine und >Beschwerden
    if Name*des Patienten* in &Patient
    else "aktualisieren_Patient 1.1"
    if keine >Beschwerden und >Bestelldatum ungultig
        then „vergeben_Termin 1.2“
    else Uebernahme Patientendaten aus &Patient
        alle Unterlagen fuer Arzt aufbereiten
        <Aufnahme Name*des Patienten* in &Warteliste
        if @Bestdat+Zeit = Kalenderdatum + Uhrzeit
            then Terminpatient Platz m+1*
                vorhergehender Terminpatient m*
        else Platz n+1*n Anzahl aller Patienten im Wartezimmer*
```

Structural Skelecon of Pseudocode (2)

```
action empfangen_Patient
  while (Patienten oder Praxisoeffnung)
    seq Eingabe >Bestelldatum, >Beschwerden
    if (@Bestdat+Uhrzeit enth. &Termine)
      then Bestellpatient
    else if (@Gebdatum+Name enth. &Patient)
      then ziehen Patientenakte
      else call aktualisieren_Patientendaten
    endif
    if (>Beschwerden <> 0*vorhanden*)
      then Unbestellter_Patient
      else call vergeben_Termin
    endif endif
    Aufbereiten aller Unterlagen fuer Arzt endseq
    if (Bestellpatient)
      then <Aufnahme Platz m+1 in &Warteliste
      else <Aufnahme Platz n+1 in &Warteliste
    endif endwhile
stop
```

LATEX, XML and Pseudocode

- ▶ Markup languages structure pseudocode with **markup tags**.

```
\documentclass{article}

\title{My first Document}
\author{John Doe}
\usepackage[english]{babel}

\begin{document}

\maketitle

Hello World! My name is John Doe.

\emph{Next paragraph has to be written.}

\end{document}
```

Support for Pseudocode

- ▶ LaTeX-distributions have good style packages for pseudocode:

- algorithms.sty
- \usepackage{algpseudocode}
- \usepackage{algorithmicx}
- listings.sty

- ▶ See also ELAN, the semi-natural programming language

- <http://de.wikipedia.org/wiki/ELAN>
- Part of OS L3, predecessor of L4

```
PACKET stack handling DEFINES push,pop,init
stack:
    LET max = 1000;
    ROW max INT VAR stack;
    INT VAR stack pointer;
PROC init stack:
    stack pointer := 0
END PROC init stack;
PROC push (INT CONST dazu wert):
    stack pointer INCR 1;
    IF stack pointer > max
        THEN errorstop ("stack overflow")
        ELSE stack [stack pointer] := dazu wert
    END IF
END PROC push;

PROC pop (INT VAR von wert):
    IF stack pointer = 0
        THEN errorstop ("stack empty")
        ELSE von wert := stack [stack pointer];
            stack pointer DECR 1
    END IF
END PROC pop

END PACKET stack handling;
```

- <http://os.inf.tu-dresden.de/L3/usrman/node10.html>

Summary

- ▶ Parser generators belong to the tool set of a software engineer
- ▶ Parsers can parse
 - Texts (lines of rows)
 - CSV relations (lines of delimiter-separated tuples)
 - Pseudocode with island grammars
- ▶ The parser only parses the context-free structure of the programs, document, or model;
- ▶ Syntax trees are built from a mapping of concrete to abstract syntax
- ▶ Context conditions, integrity and wellformedness constraints are delayed to the *static semantic analysis* on the syntax tree

The End

- ▶ Why is a parser often delivering several results (parses)?
- ▶ How can you disambiguate ambiguous rules?
- ▶ Why is string parsing not the same as tree parsing? What is the difference of concrete and abstract syntax trees?
- ▶ Explain the difference of
 - A string grammar vs a tree grammar
 - A concrete syntax grammar (CS grammar) vs an abstract syntax grammar (AS grammar)

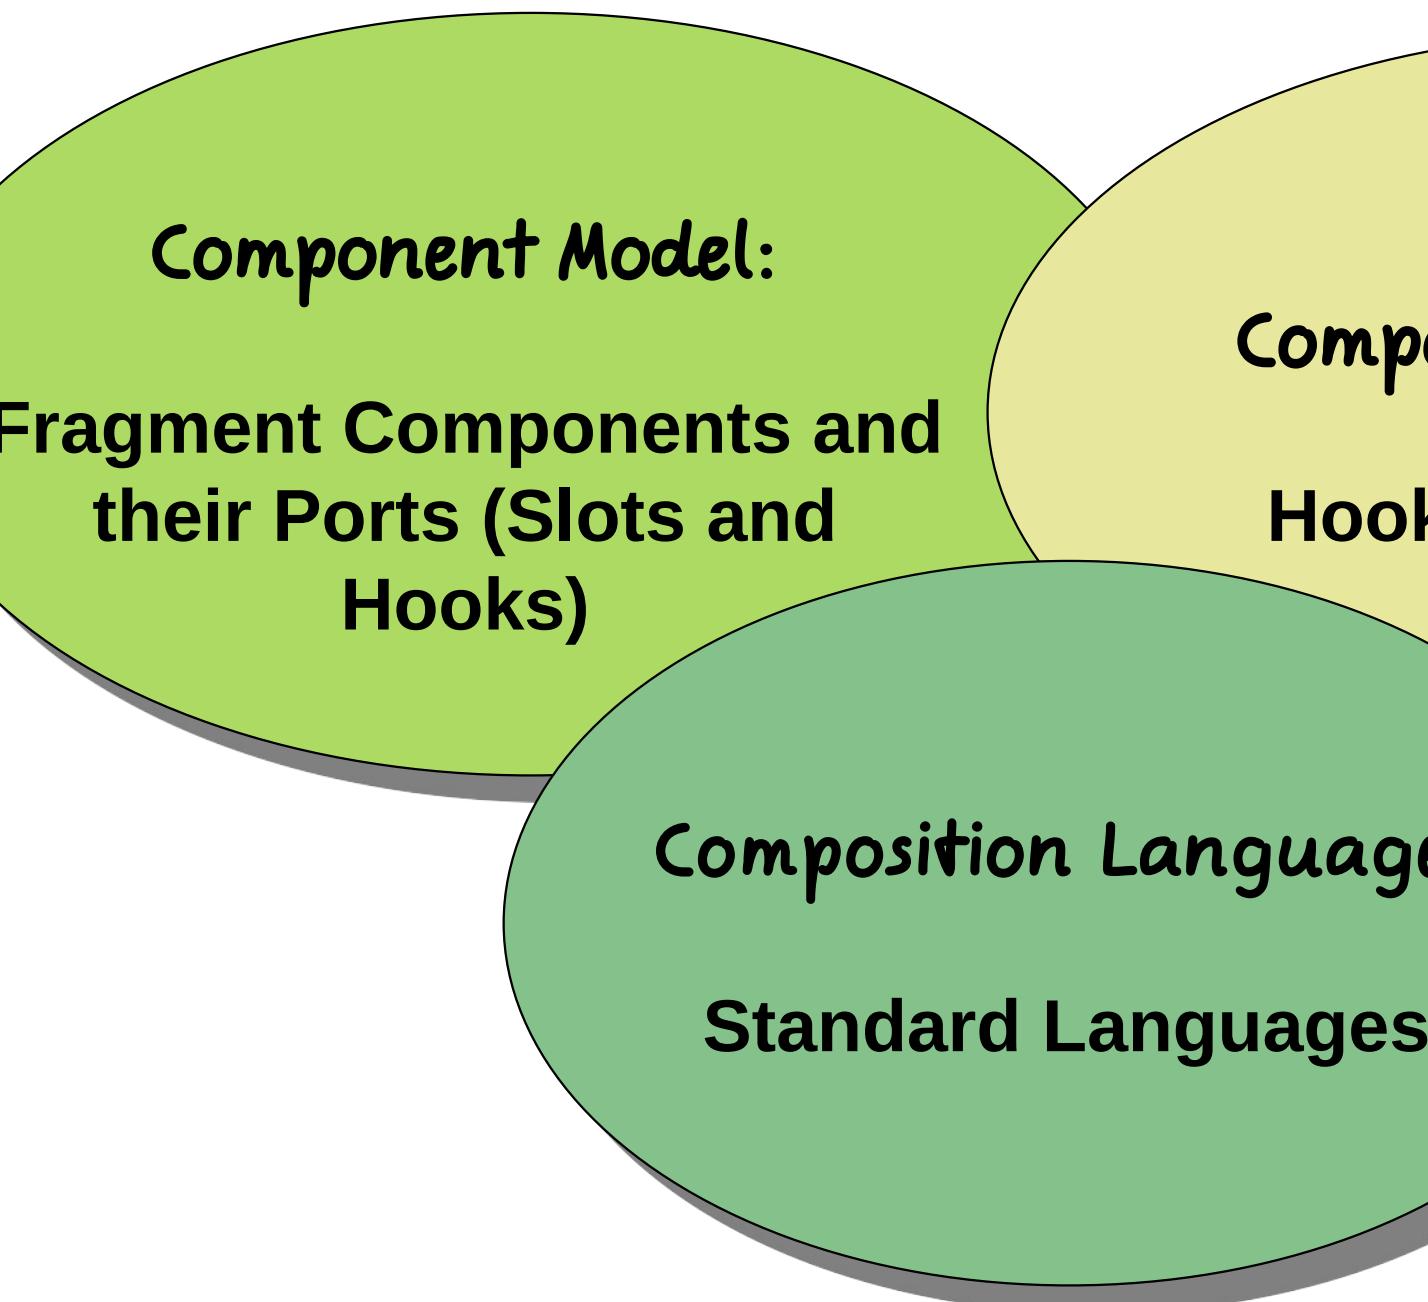

20.A.1 Port-Graph Algebrae on Fragments

Invasive Software Composition is a general, typed templating technique for all languages

- ... based on port-graph algebrae
- ... with Graybox Components
- ... preview onto the summer (CBSE course)

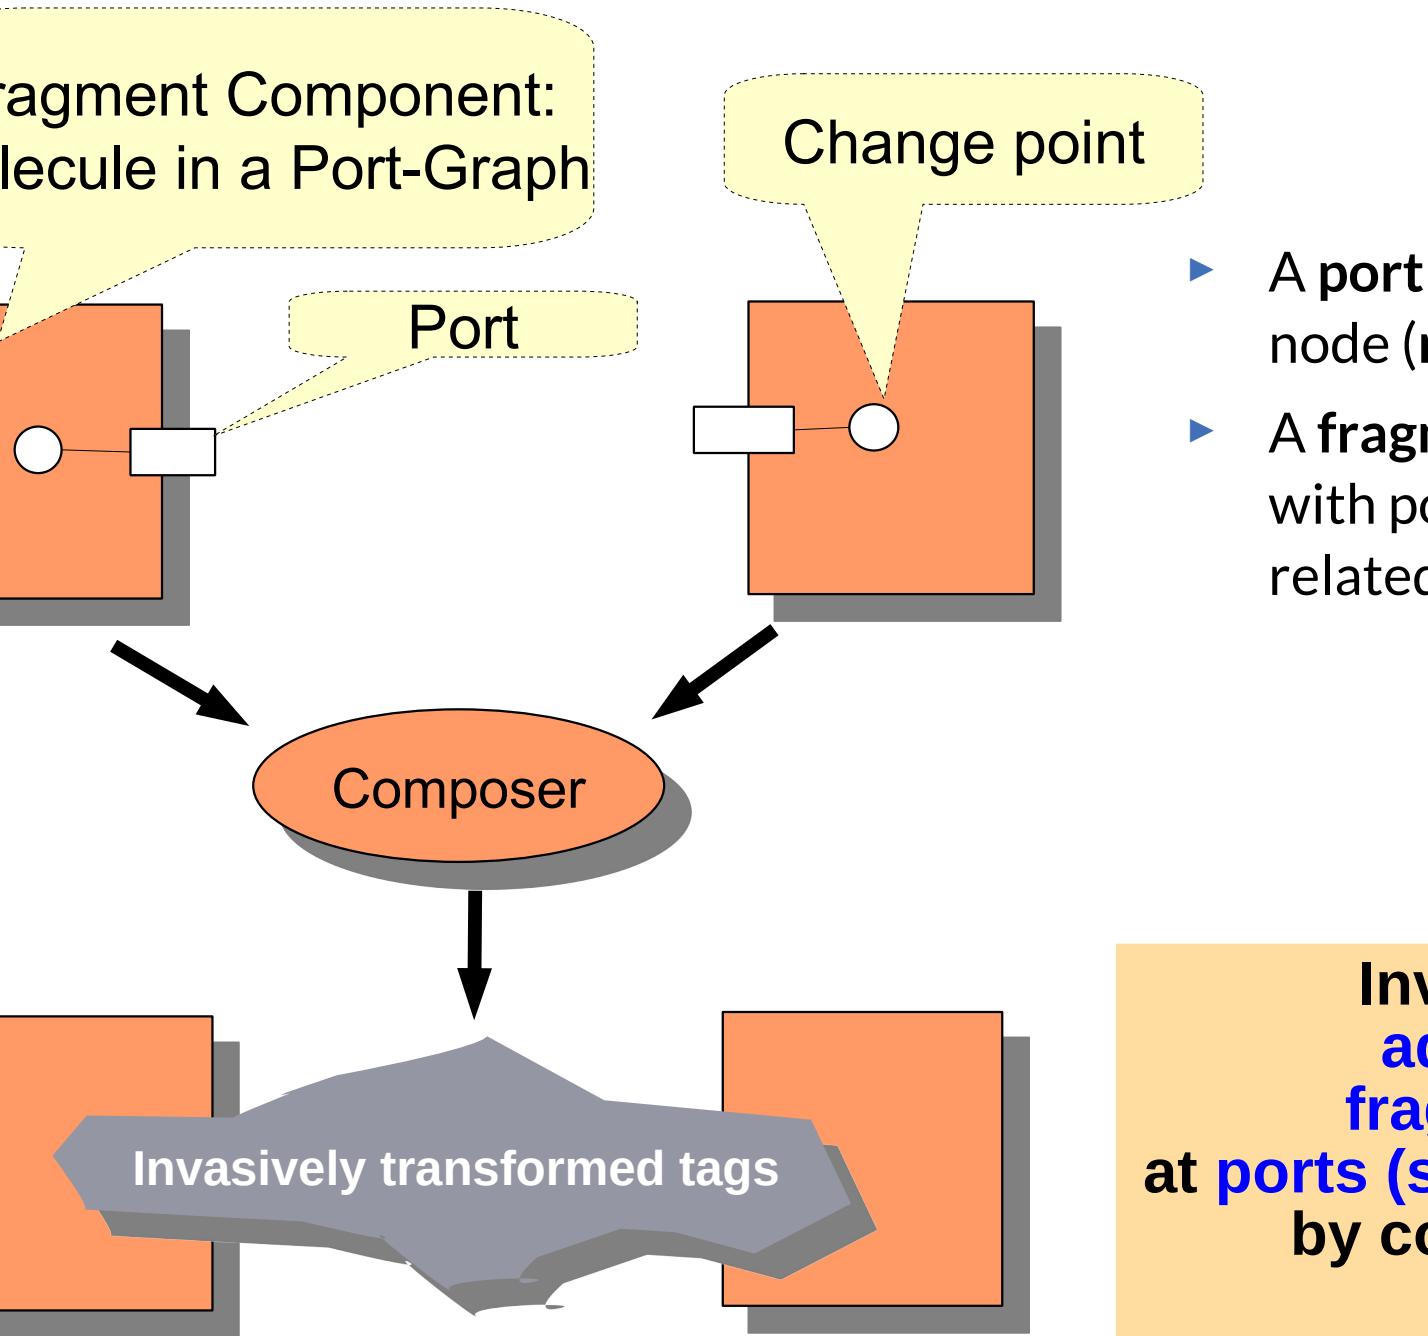

“Invasive” Composition (Typed Template Algebrae)

Model-Driven Software Development in Technical Spaces (MOST)

Invasive Composition as Hook Transformation

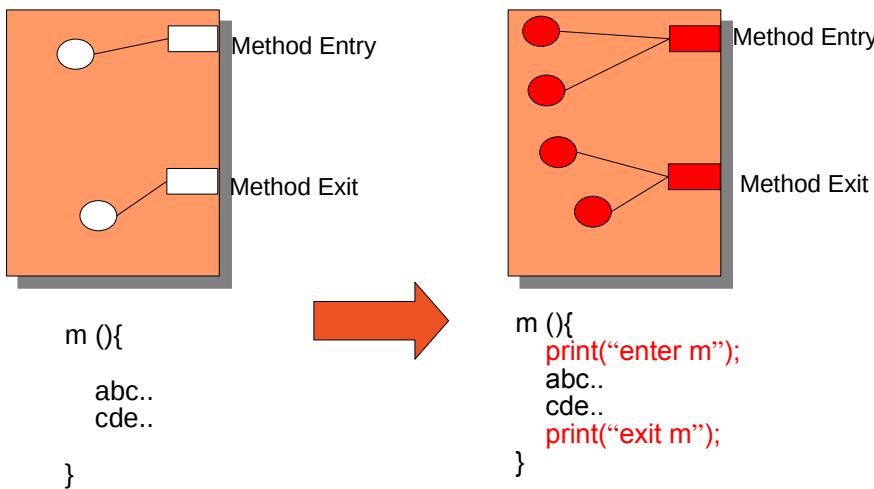

Model-Driven Software Development in Technical Spaces (MOST)

Binding Implicit Hooks with Fragments

65

Model-Driven Software Development in Technical Spaces (MOST)

```
component.findHook(..MethodEntry").extend("print("enter m");");  
component.findHook(..MethodExit").extend("print("exit m");");
```

Partial Parsing of Fragment Components

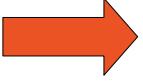

66

Model-Driven Software Development in Technical Spaces (MOST)

m (){
abc..
cde..
}

Method Entry

Method Exit

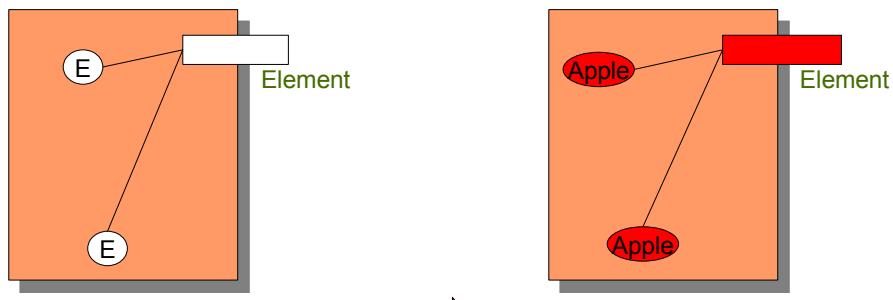

m (){
// Method Entry
abc..
cde..
// Method Exit
}

```
Component = compositionSystem.partialParser("m (){ abc.. cde.. }");
```

Binding Declared Hooks with Fragments

67

Model-Driven Software Development in Technical Spaces (MOST)

List(**E**) list;

....
list.add(new **E**());
....

List(**Apple**) list;

....
list.add(new **Apple**());
....

box.findHook("Element").bind("Apple");

s Hook Transformations

OST)

- ▶ Invasive Composition works uniformly on
 - For all languages
 - For declared hooks and implicit hooks
- ▶ Allows for unification of
 - Inheritance
 - Views
 - Aspect weaving
 - Parameterization
 - Role model merging

Operators in a Port-Graph Algebra

Simple composition operators

- ▶ **bind hook (parameterize)**
 - For generic programming
- ▶ **rename component, rename hook**
- ▶ **remove value from hook (unbind)**
- ▶ **extend component or hook extensions**
- ▶ **copy fragment component**

Compound composition operators

- ▶ **inheritance from component**
 - For object-oriented programming
- ▶ **view of component**
 - view-based programming
- ▶ **connect hook 1 and 2**
 - For connector-based programming
- ▶ **distribute component over other component**
 - For aspect weaving
